NOTES

How to Use Our Business and Product Sections

The Business and Product Sections of this Directory are included for the service of members so that this book will be complete as an index of an industry—listing Engineers, the Businesses they have founded, and the Products they have created for radio, television, communications, and electronics.

The following 4 Parts of the IRE DIRECTORY are:

Part		Page
	Pink Section—Guide to Products	i-viii
2	Company List of Radio-Electronic Manufacturers	3
3	Product Index of Engineering Equipment and Parts	73-295
4	Catalogs and Complete-Data-Spreads Section	297
	—Advertisers Index—Cover III, 295-6—	

Part 2

2277 firms have supplied us voluntarily with information about the components, equipment and services which they render the radio-electronic industry. The manufacturers are listed alphabetically in this section beginning on page 3 and ending on page 72. 1049 non-manufacturers such as distributors and representatives are listed under heading 9, a special directory. This index therefore gives the names of manufacturers of specific products available for purchase, with their addresses and code numbers indicating 101 types of products which they offer.

The completeness of this list depended on information voluntarily supplied us. Our most vigorous efforts may not have made it complete, but the excellent cooperation received from most of the industry is directly responsible for the up-to-dateness of our product data. We will welcome additions and suggestions for the 1953 edition.

Part 3

The Product indexes start on page 73 and continue through 295. In both the alphabetical and the product indexes advertisers who have made it financially possible to provide a really comprehensive Directory to IRE members, have been listed in bold face type with a cross index to the page on which their display advertisement appears—giving complete information on their products and services. Non-advertisers have been listed in the product indexes giving firm name and state only. For full address the reader must turn to the alphabetical index for these companies.

To find the advertisers of a given product, let us say "Amplifiers" look this product up in the Pink Section, just after Part 1—Members. You will see that it is classification Number 005. A full listing of Amplifier manufacturers starts on page 73. Turn to this classification in part 3.

As a service to engineers, both buyer and seller, we have included a list of 1049 firms and individuals who are distributors. Each name is further classified by number to indicate its place in the field—representative, distributor, exporter, etc. This is class #9, starting on page 277.

There are several other helpful indexes. Advertisers are given on Cover III (inside back cover) and pages 295-297; and an index to 1952 Radio Engineering Show Exhibitors is on pages 356-359.

To get a comprehensive picture of what a given firm manufactures for engineers in our field, you will find in the alphabetical index of companies that all their products are listed by code number after the firm's name and address. An innovation this year is the use of ten (10) separate Product Directories, serving basic sections of our industry. We have tried vigorously to make this truly a useful "Radio Engineers Directory."

Part 4

Part 4 is one of the most informative and valuable sections of this Directory. Here manufacturers are supplying engineers with the maximum amount of detailed information possible through the use of multiple page spreads of their products (see pages 297-360). This is followed by a complete catalog file supplied by 16 manufacturers. These catalogs are filed in alphabetical order. The purpose of this section is to give the engineer a complete and ever available catalog file right in his IRE Directory where he can always see it easily and quickly. We believe that the services of this section will be of the utmost help to you.

Please submit all changes, corrections, additions and classification questions to Industry Research Div. c/o Proceedings of the IRE, 303 West 42nd St., New York 36, N.Y.

1952 Edition prepared by The Advertising Department of The Institute of Radio Engineers, 303 West 42nd Street, New York 36, N.Y.

How to Use the Machol Edge Index

High speed reference is a major objective of the IRE Directory. To this end we have adopted the Machol Edge Index system, and these indexes:

Advertisers Index, pages 295 & 296 and inside back cover.

Key to Products, Pink Section

Index to Spreads & Catalogs, 297 & 360.

Guide to Machol Thumb Indexes facing 72.

The Machol system will help you find both alphabetical and product sections swiftly.

INSTRUCTIONS

1. **Place the four fingers of your RIGHT hand back of the last page of this book.**
2. **Place your RIGHT thumb just below the 1 or 2 line symbol adjacent to the section you want.**
3. **Raise your RIGHT hand slightly and push it to the left bending the pages almost double. *This will spread the edges and cause the edge marks to show more clearly.***
4. **Move your RIGHT thumb across the page edges, fanning the pages until you reach the corresponding symbol.**
5. **Open there—that will be the page you want.**

M KELLOGG W — SUBSIDIARY OF PULLMAN INCORPORATED

KEL-F

VOLUME-PRODUCTION PRICING NOW RADICALLY BROADENS SCOPE OF APPLICATIONS FOR THIS UNIQUE THERMOPLASTIC

Volume demand now measured in the hundreds of tons and improved production methods—have combined to radically reduce the per lb. cost of Kel-F. Further, experience has shown that potential applications require only small quantities of Kel-F per finished item, because of the plastic's superior properties. In view of these two facts, design engineers are currently reevaluating the use of Kel-F for all applications where the seven basic Kel-F properties meet design or performance specifications.

LEADING MOLDERS NOW OFFER KEL-F PARTS AND BASIC MATERIALS

Already, more than 50 leading molders in the country are prepared to deliver Kel-F tubing, rod, sheet, film and strip in a variety of sizes and types of material. Many of these are supplying not only these basic fabricating materials but are also producing finished parts by the standard methods such as compression, transfer, injection and extrusion molding.

TECHNICAL BULLETINS, SERVICES NOW AVAILABLE...

Detailed data—in bulletin form—on physical properties molding techniques, dispersions and other Kel-F products are available. The Chemical Manufacturing Division's Technical Service Department has been augmented to offer additional help to design and materials engineers, as well as molders, in the use of this unique material.

USE KEL-F when applications require — Properties

CHEMICAL INERTNESS
No effect has been observed after prolonged exposure of Kel-F to concentrated sulfuric, hydrofluoric and hydrochloric acids; to strong caustic; to fuming nitric acid, aqua regia and other vigorous oxidizing materials. It is equally resistant to most organic solvents.

ELECTRICAL RESISTANCE
Kel-F has high resistance to electricity . . . is a poor conductor of heat . . . and its electrical properties are superior to most plastics. Dielectric constant is in the range of the best available materials.

ZERO MOISTURE ABSORPTION
In continuous tests, Kel-F exhibited zero water absorption. It is not wet by water . . . is unaffected by high humidity or tropical exposure.

WIDE TEMPERATURE RANGE
Kel-F performs satisfactorily over a temperature range of 710 fahrenheit degrees — from a low of —320° F. (liquid nitrogen) to a high of 390° F.

MECHANICAL STRENGTH
Kel-F has high tensile strength on the order of 6000 psi at 77° F . . . excellent impact strength and abrasion resistance.

SUPERIOR MEMORY
Kel-F exhibits "cold-flow" characteristics superior to any other commercial fluoro-carbon. While it deforms slightly under pressure, it returns to original shape when pressure is released.

MOLDABILITY — MACHINABILITY
Kel-F is molded by all standard methods — compression, transfer, injection and extrusion. It is readily punched, drilled or otherwise machined to close tolerances.

WIDE VARIETY IN FORM
Kel-F is available in film, sheet, rod and tubes from recognized molders. As a dispersion for spray or dip application and in form of oils, greases and waxes it is available direct from Kellogg.

Pin-pointed for its target...

Increasing air-speeds and higher level flight pose ever tougher problems for bombing accuracy. But modern engineering takes such problems in stride. Today's bombardiers pin-point targets with bombing systems of extraordinary precision and nearly instantaneous action.

Engineering and developing these and similar complex electronic or electro-mechanical devices are the work of Arma Corporation. For 34 years Arma has collaborated with the Armed Forces—and more recently the Atomic Energy Commission—on such complex instruments. Adaptations of these systems will be readily applied to our industrial might in the future. Arma Corporation, Brooklyn, N. Y.: Mineola, N. Y.; Subsidiary of American Bosch Corporation.

If you are interested in an engineering career with challenging opportunities, we suggest you write for this booklet "Engineering at Arma." Write today to Engineering Division, Arma Corporation, 254 36th St., Brooklyn 32, N. Y.

Bendix ROTARY POWER SUPPLIES

DYNAMOTORS, INVERTERS, MOTOR GENERATORS
Designed to meet the EXACT Requirements of Each Application!

● Whenever DC is available, Bendix will tailor a complete power supply or motor from standard, mechanical parts to provide the exact voltage—either AC or DC—called for by your equipment.

DYNAMOTORS — essentially DC transformers — will supply one, two, or three DC outputs for direct application to electronic circuits. Radio filtering and voltage regulation are available. Compact, efficient units can be provided with outputs of 10 to 500 watts.

INVERTERS — will produce an AC output for supplying transformer-type power supplies or operating power for servos, synchros, etc. Standard models to work from 28 volts and deliver 115 volts, 400 cycles, single or three phase are available in ratings up to 2500 VA. Frequency and voltage are closely regulated in all models.

MOTOR GENERATORS — are available for furnishing combinations of DC and AC and for various special requirements.

MOTORS — for performing mechanical functions are designed by Bendix engineers for the most efficient utilization of space and power.

YOUR POWER SUPPLY PROBLEM will receive prompt engineering attention at Bendix. Please send a complete description of the performance required and the condition under which the supply must work. You will be answered with detailed information and specific recommendations for the most practical solution to your problem.

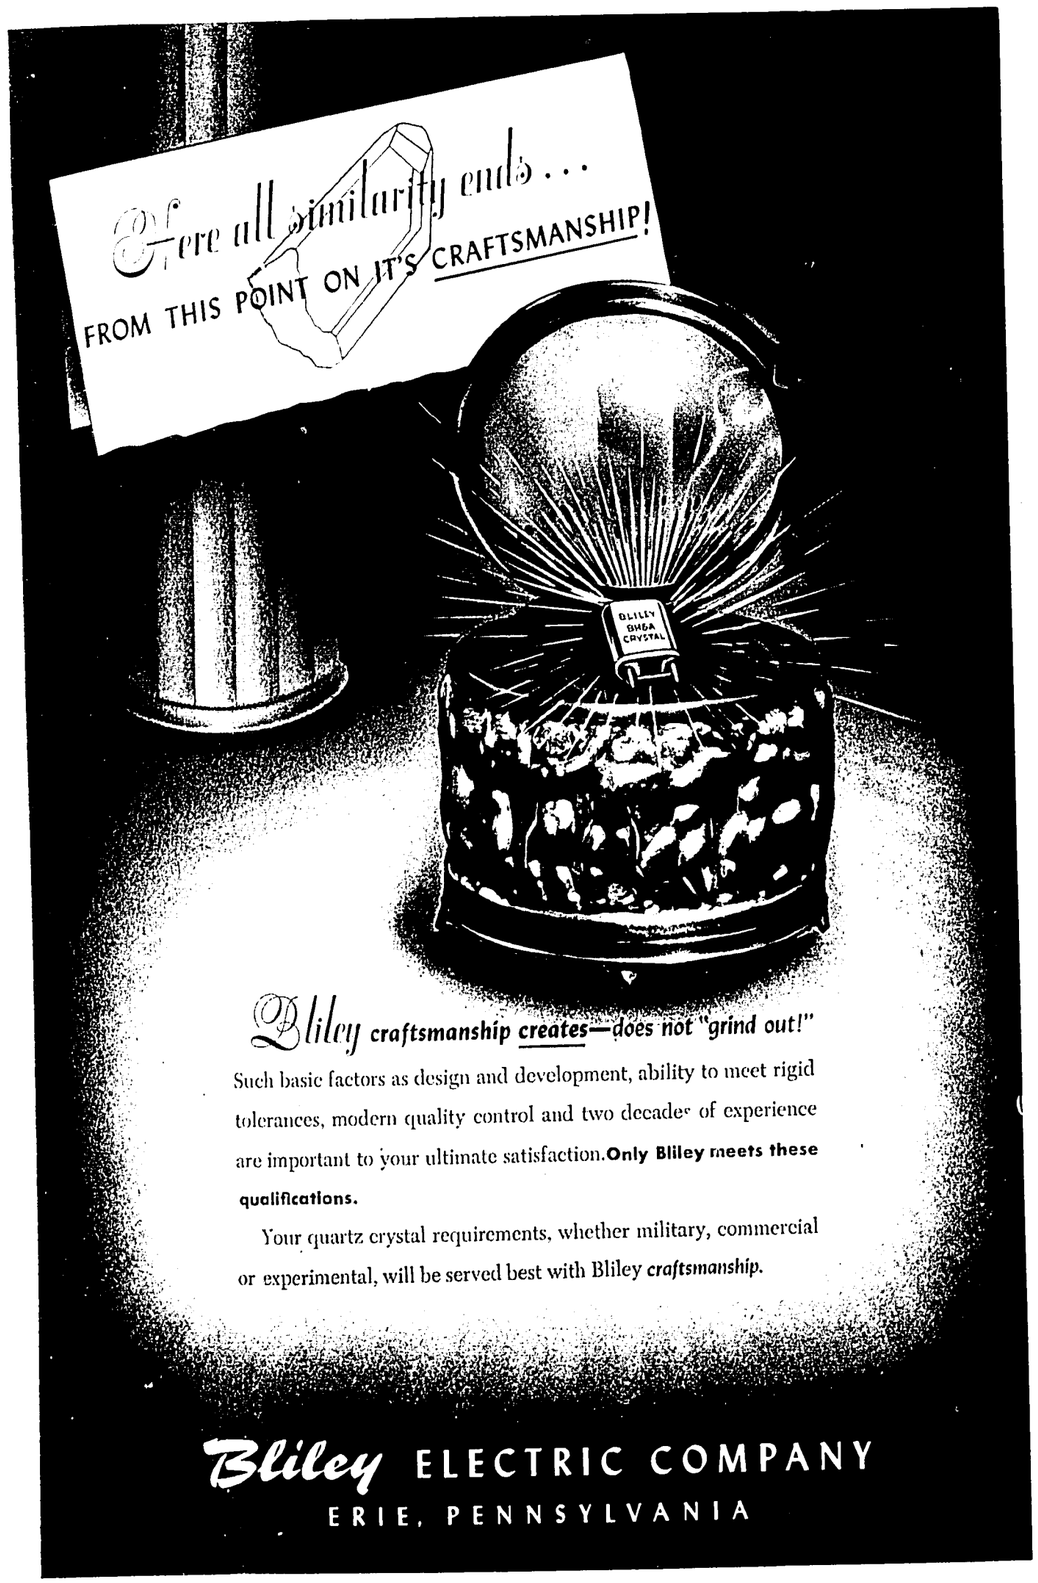
INDUCTOROIDS

TOROIDAL INDUCTANCES OF HIGH "Q"UALITY



Toroidal Inductances wound on Molybdenum Permaloy compressed powered dust cores are available in all practical inductance values. Several core sizes and types are stocked making it possible to supply high Q inductances, especially suitable for *your* frequency and load ranges. We supply Inductoroids either cased or uncased.

Filters and Equalizers

Because of their high Q, great inductance stability, and extremely low pick-up from external fields toroidal coils are highly desirable for such applications as wave filters, equalizers, and similar circuits. We supply these networks built to meet your circuit specifications or we will design and build such networks to meet your performance specifications.

Important, Send us your specific requirements.

FS MICROMETER HEAD

Built to meet the precise requirements of accuracy needed in the electronics industry, the FS Micrometer Head has been met with enthusiastic acceptance by leading engineers. Its patented thread form with radially loaded nut for elimination of back lash, and automatic wear compensation assure the continuance of this accuracy even after long, hard usage. The FS Micrometer Head is built with temperature compensating construction, large easy to-read calibrations; a thimble stop to prevent thread jamming, and many other features that contribute much to accuracy and speed in helping the electronic engineer carry out his work.

Send today for the FS Micrometer Head bulletin that gives complete data on specifications and features.

WIRES and CABLES

*Quality Control works 2 ways at CHESTER

It's a fact and here's why! First, Chester quality control engineers certify every phase of manufacture from raw material to finished product packed for shipment. No detail is too small or unimportant to merit their full attention. Second, quality in turn governs production — not a single foot of Chester wire or cable is ever "hurried through" to meet a shipping date or heavy schedule. Extra shifts, not faster production is the method used to break bottlenecks at Chester.

This two way quality control is just one of many important reasons why electrical and electronic men, in increasing number, specify Chester wire and cable for an extra measure of reliability. Why not check your requirements with Chester today.

CRUCIBLE ALNICO MAGNETS

KEEP COSTS DOWN ... *through automatic production that gives quality control*

Alnico magnets have been getting smaller and lighter, thanks to production techniques in use at Crucible. Automatic machinery cuts the possibility of human error to a minimum, so rejections are low. This helps to maintain stable price levels in the face of rising material and labor costs. At the same time, Crucible's rigid inspection standards and attention to quality have developed a magnet with the *highest gap flux per unit weight of any on the market.*

Today, Crucible can offer lighter, magnetically stronger Alnico magnets because of these automatic production techniques developed over the sixteen years that we have been producing the Alnico alloys. And behind our familiarity with permanent magnets lies more than 52 years' experience with specialty steelmaking. Let us advise you on your magnet problem.

MODEL 200-A DC MILLIVOLTMETER

DC Measurements

5 MICROVOLTS to 10 VOLTS

A precision converter, that changes the input DC into an amplified, sinusoidal AC Voltage

- 5 Microvolts internal noise
- 2 Megohms input resistance
- Stabilized gain and zero
- Insensitive to power line pickup

Makes the AC Vacuum tube Voltmeter direct reading in DC microvolts and millivolts.

With the cathode ray oscillograph yields an extremely sensitive DC null detector.

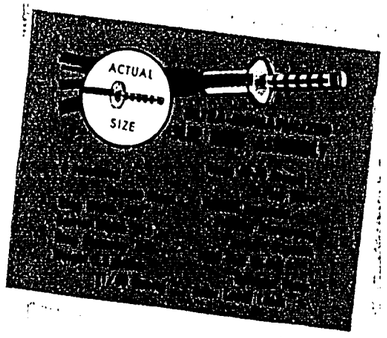
EXCLUSIVE* *ELECTRO TEC* TECHNIQUES

insure closer tolerances, absolute uniformity, and the ultimate in miniaturization



Electro Tec units are the product of an exclusive manufacturing technique that results in accuracy unattainable by conventional fabricating methods. In this process a plastic is moulded around the wire leads. Accurate machining reduces this blank to the proper shape, complete with grooves. Hard silver is deposited into the grooves by electroplating to produce the required rings. Final machining insures concentricity and dimensional accuracy. The result is one-piece, unitized construction with conducting rings of 60 to 70 Brinell hardness.

Diameters of these assemblies range from .045" to 24" cylindrical or flat. Cross-sections may range from .005" to .060" or more. Rings are polished to a jewel-like finish and can be held to 4 micro-inches or better. Even the smallest sizes withstand a 1000 V.A.C. breakdown test. Most types easily withstand rotational speeds up to 12000 rpm.

ELECTRO TEC Assemblies are Specified by the Nation's Leading Precision Instrument and Equipment Manufacturers for Proven Greater Dependability, Longer Life, Smoother Functioning.

The uniformly superior performance of Electro Tec slip ring and commutator assemblies in thousands of industrial and governmental applications has resulted in wide adoption of these component units by most leading manufacturers of precision instruments and equipment. Although these products provide improved performance and extra dependability, prices are strictly competitive. Write today for fully illustrated literature.

- ONE PIECE, UNITIZED CONSTRUCTION
- ABSOLUTE MINIMUM TORQUE FRICTION
- DIAMETERS FROM .045" TO 24.0"
- MINIMUM 1000 V.A.C. HI-POT INTER-CIRCUIT
- UNIFORMLY HARD SILVER RINGS PLATED INTO GROOVES ON PRECISION MACHINED ONE PIECE PLASTIC FORM
- SPECIAL SURFACE DEPOSITS PREVENT TARNISH, MINIMIZE FRICTION, BRUSH NOISE AND PRACTICALLY ELIMINATE WEAR

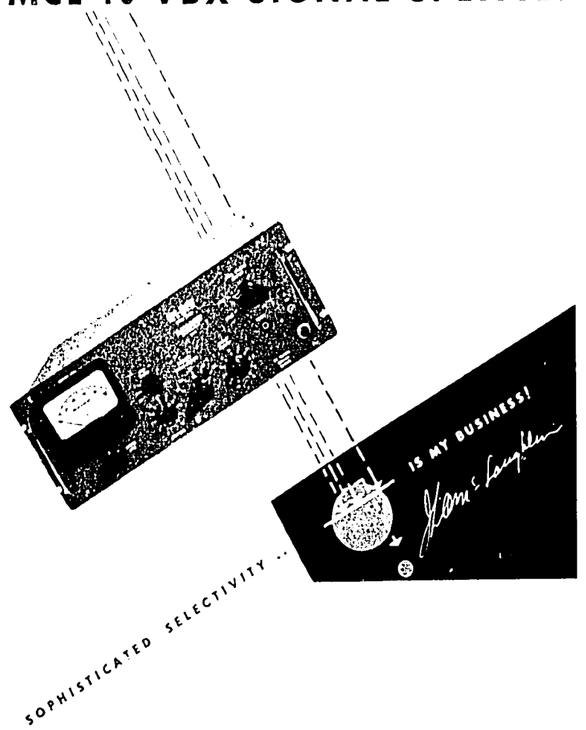
New Freedom FROM JAMMING!

SIGNAL-SPLITTER MCL-10-VBX eliminates adjacent-channel and heterodyne interference to either CW, narrow-band voice or broadcast-quality receptions—will separate two carriers on the same "assigned" frequency when difference is but .005% with 60db attenuation to jamming carrier at carrier frequencies of the order of 10-15 MC.

Signal-Splitters are used with standard communications receivers.



This new variable selectivity model can be supplied with from three to seven selectivity switch positions in either selected sideband, providing a total of fourteen useful single-sideband widths from 100cps out to 10,000cps with high attenuation to all frequencies outside the selected passband.

Carrier accenter circuit greatly reduces the distortion effects of selective-fading and high-percentage modulation detection — signal carrier is raised 20db above sidebands.

Used by nine Departments and Agencies of U. S. Government and many foreign communications companies and governments to protect their radio-telephone telegraph circuits from bad jamming.

Signal-Splitter installations over ten years old are still in service. Write for descriptive literature on the MCL-10-VBX and other Signal-Splitters.

MODERN DESIGN AND ENGINEERING

The automobile and aircraft industries owe much of the success of their products to the modern solution of their angular drive problems with flexible shafting. The right application of a flexible shaft can mean greater flexibility in alignment . . . better integration of units . . . less complex gearing.

The result is lower assembly costs and a product that is quiet, smooth, efficient and trouble-free in operation with minimum repair requirements. Circle Ess flexible shafts will stand the most rigid tests and scrutiny. They will help to solve your problems as they have those of many other manufacturers.

Write for our new book "Flexible Shaft Assemblies."

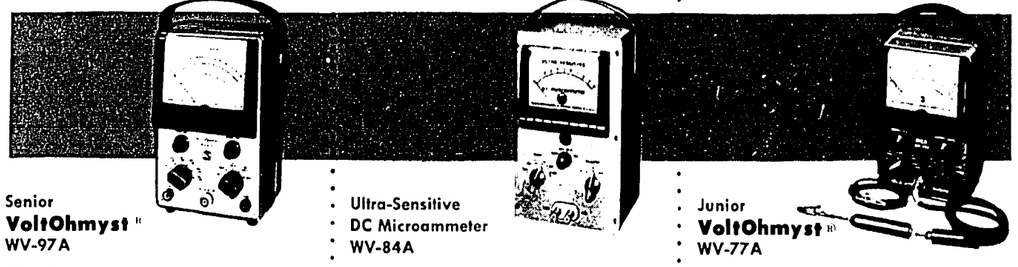
RCA Measuring Instruments

...for research, production, and servicing

Television Calibrator
WR-39C



Variable-frequency oscillator provides fundamental output over entire range, with crystal-controlled check points at 2.5-Mc and 0.25-Mc intervals. Provides 4.5-Mc crystal-oscillator signal for inter-carrier alignment and for dual markers at TV carrier frequencies. Harmonic output useful in the UHF range. The WR-39C is a heterodyne frequency meter, a crystal standard (with 3 crystals supplied), a bar-pattern generator, and a TV re-broadcast transmitter.

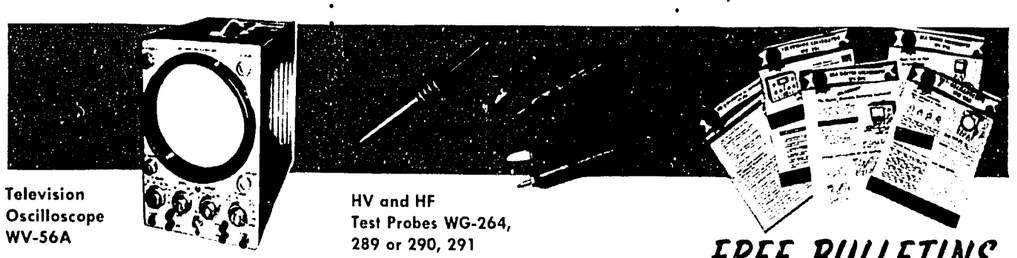
Television Sweep Generator
WR-59B

Covers all TV channels on preset fixed positions. Continuous tuning range from 300 Kc to 50 Mc covers video and intermediate frequencies. High-precision vibrating capacitor provides up to 12-Mc maximum sweep width, flat within ±1 db, with good linearity. Has dual-piston attenuator for varying output voltage from 0.1 volt to 5 microvolts. Includes blanking for zero-reference line on 'scope.

Master VoltOhmyst®
WV-87A

Has big 8½" meter. Measures dc voltages accurately in high-impedance circuits, with ac present. Also reads rms values of sine waves and peak-to-peak values of complex waves or recurrent pulses, with dc present. Measures resistance from 0.1 ohm to 1000 megohms, current from 10 microamperes to 15 amperes. Features ±1% tolerance multiplier and shunt resistors, a meter movement having an accuracy within ±2% and a tracking error of only ±1%. Complete with cables and probes.

Senior VoltOhmyst®
WV-97A



Directly measures complex waves from 0.2 volt to 2000 volts, peak-to-peak. Has an overall accuracy for dc measurements of ±3% full scale. Measures dc voltage from 0.02 volt to 1500 volts . . . rms values of sine-wave voltages from 0.1 volt to 1500 volts. Has 7 non-skip ranges for both resistance and voltage. Frequency response flat from 30 cps to approximately 3 Mc on low ranges. AC operated. Complete with cables and probes.

Ultra-Sensitive DC Microammeter
WV-84A

Reads from 0.0002 microampere to 1 milliampere in six ranges. Also useful for measuring extremely high values of resistance, or as a high-resistance voltmeter with a maximum sensitivity of 100 megohms per volt. Accuracy, ±5% or better . . . invaluable for conducting experiments involving mi. ute values of direct current. Battery operated.

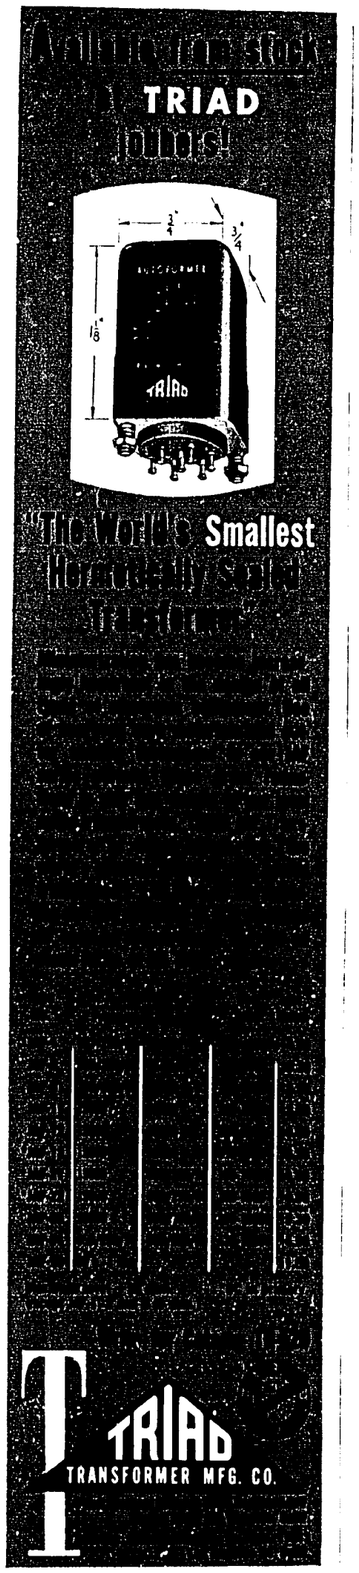
Junior VoltOhmyst®
WV-77A

Measures dc from 0.05 volt to 1200 volts; ac from 0.1 volt to 1200 volts rms; and resistance from 0.2 ohm to 1 billion ohms; five overlapping ranges in each case. Uses electronic bridge circuit, 200-microampere meter movement, and ±1% carbon-film multiplier resistors. Over-all accuracy, ±3% for dc measurements on plus setting. Frequency response flat from 30 cps to 3 Mc on low ranges. AC operated. Complete with cables and probes.

Television Oscilloscope
WV-56A

Uses 7" CR tube and direct-coupled, 3-stage, push-pull, vertical and horizontal amplifiers. Dual controls for "coarse" and "fine" adjustments. Frequency-compensated and voltage-calibrated attenuators on both amplifiers. Response flat within −2 db from dc to 500 Kc, within −6 db at 1 Mc. Vertical deflection sensitivity, 10.6 rms millivolts per inch. Magnetic shield on CR tube reduces effects of external fields.

HV and HF Test Probes WG-264, 289 or 290, 291



High-voltage probes for measuring voltage of TV power supplies and other high-voltage sources. *WG-289* has microphone-type connector; *WG-290* has phone-tip connectors. *WG-264* Crystal-Diode Probe, for measuring ac voltages at frequencies up to 250 Mc. *WG-291* Demodulator Probe, for measuring positive peaks of modulated waveforms.

Robinson MET-L-FLEX Engineered Mounting Systems, Mounting Bases and Unit Mounts are compact, rugged and effective. They feature an exclusive all-metal resilient element, made of knitted stainless steel wire, fabricated and compressed. This cushion provides wide environmental tolerance with high built-in damping, resulting in "Sea level performance at any altitude". Its non-linear deflection characteristics permit optimum performance under load variations of as much as ±50% of mean ratings. Auxiliary MET-L-FLEX limiter pads afford additional protection against extreme overloads and impacts.

Further "Plus Features" exclusive with all MET-L-FLEX Mounts and Mounting bases are: negligible drift rate; wide temperature tolerance (-90°C to +175°C); and amazingly long service life without maintenance. They completely lack those faults and weaknesses inherent to mountings incorporating organic or plastic materials.

The "Plus Features" of Robinson Mountings, providing performance in excess of current specifications, pay off in maximum protection of the mounted equipment.

For complete performance and construction details, write for Technical Bulletin EB-700 and the telephone number of your local representative.

Four Tung-Sol Electron Tubes receive a terrific jolt as the heavy steel battering ram smashes against the movable table on which they are mounted. With an acceleration up to one thousand times the pull of gravity, this testing machine can give tubes a wicked beating.

Like other manufacturers, Tung-Sol is producing its share of defense requirements and it is vigorous Quality Control procedures such as this which give Tung-Sol Tubes the exceptionally high degree of uniformity preferred by the armed services. Quality Control is a whole series of exacting tests and inspections which point the way to better, more dependable tubes—sturdier both mechanically and electrically. Ruggedized Tubes we call them.

The ruggedized feature embodied in Tung-Sol Tubes for radio, TV and special industrial applications means top performance, longer and more efficient service life, plus lowest maintenance. So, for whatever purpose you use electron tubes, you'll find greater satisfaction with Tung-Sol Tubes and Tung-Sol Service.

Write for sales or engineering information, or for the name of the Tung-Sol distributor nearest you.

The four tubes are mounted in different positions to determine stability in all directions. Each tube is wired to a control panel where any electrical damage is recorded by indicator lights.

Part Three—1952

The Business and Product Sections of this Directory are included for the service of IRE Members, so that this book will be complete as an index of an industry—listing Engineers, the Businesses they have founded, and the Products they have created for radio, television, communications and electronics.

Grateful acknowledgement is made to the nearly 3000 firms who so helpfully cooperated by answering our detailed questionnaires, and to the 367 advertisers whose informative advertising, and financial investment in space have made this project possible.

Parts 2 through 4 have been prepared by the Advertising Department, plan and make-up by William C. Copp; supervision, Lillian Petranek; research, Frank G. MacAloon; production, Martha Usdin. Directory 9 includes information supplied by NEDA and The Reps. All product data is from questionnaires, Product News Stories and salesmen's reports received in 1951 and 1952, and firms not answering within 18 months of publication have been omitted for the sake of accuracy.

The complete code-key to products is given in the pink pages between Parts 1 and 2, just after the membership section. A cross-index by products in alphabetical order is also included. The Machol Edge Index this year guides you to the ten separate product and service sections only; and the numbers at the end of each address in the List of Firms corresponds to these directories—thus classifying each firm. In the Product Directories 101 major groups are further defined by sub-class numbers after a firm's listing, which gives you great product detail, simply grouped.

The initials "ADC" on a transformer, reactor or filter indicate a product custom-built by Audio Development Company for a definite function in a special field—and for a particular company.

Your own types of electrical or electronic construction may demand a transformer, reactor or filter of original design. When the question arises—to whom shall you go for competent design and construction of these component requirements — the answer is, ADC. For in ADC's efficient manufacturing plant capable engineers actually supervise each productive process from start to finish.

Moreover, the "Model Shop" maintained by ADC fashions precision models based on blue print instructions—and supplies you with sample units which permit dimensional check-up and observance of performance.

Our field representatives are trained men, well acquainted with our operation. For prompt response, summon the one in your area or contact our Home Office.

MODEL 1040 A.C.-V.T. VOLTMETER

USES

The type 1040 Vacuum Tube Voltmeter is a high impedance wide frequency range voltmeter which can be used at audio and supersonic frequencies. It is particularly recommended for (1) vibration studies involving very low frequencies, (2) frequency characteristics and gain measurements on amplifiers, (3) transmission losses on telephone circuits: filter and carrier systems up to 250,000 cycles, and (4) acoustic measurements, such as, determination of frequency response of microphones and loudspeakers. Because of the high sensitivity of the instrument, the voltmeter can be advantageously used as a null detector in A.C. bridge measurements. In addition to its use as a voltmeter, the instrument can be used as an ammeter to measure a wide range of currents by connecting it across suitable resistors.

FEATURES

Because of the low input capacity, a high value of input impedance is maintained over the five ranges of the voltmeter. A balanced rectifier, a balanced D.C. amplifier circuit, and a high amount of degeneration throughout the amplifier makes it independent of line voltage variations and changes in tube characteristics. A very important feature of the instrument is the logarithmic voltage scale of the meter. With this type of scale, the percentage accuracy of reading is uniform over the entire scale. Another advantage of the logarithmic scale is that it provides a uniform decibel scale which is a very valuable feature in sound and communication measurements. A zero adjustment and full scale adjustment are provided. These two controls serve for all ranges and no re-setting is necessary when switching from one range to another. The time constant of the instrument is adjusted in order to read very low frequencies of 7 to 10 cycles without any vibration of the needle. The circuit of the meter is arranged so that it can not be burned out by any overload of the instrument. The vacuum tube voltmeter is small, compact, entirely self-contained, A.C. operated.

SPECIFICATIONS

Voltage Ranges: 0.001 volts to 100 volts in five ranges (0.01, 0.1, 10, and 100 volts full scale).

Accuracy: 2% on full scale on all five ranges, on sinusoidal voltages.

Waveform Error: The instrument is a peak voltmeter calibrated to read RMS values. On distorted waveforms, the percentage deviation of the reading from RMS values may be as large as the percentage of the harmonics present.

Frequency Ranges: 10 to 200,000 cycles, 0.1 db. variation from 20 cycles to 150,000 cycles: 0.50 db. variation from 10 cycles to 200,000 cycles.

Input Impedance: Equivalent to 500,000 ohm resistance in parallel with a 15 MMF. condenser.

Stability: Effect of variation in line voltage from 100 volts to 125 volts is 1%. Effect in changes of tubes is less than 0.5%.

Scale: Logarithmic voltage scale calibrated from 1 to 10 plus a linear decibel scale calibrated from 0 db. to 20 db.

Meter: 4" suppressed zero 1 MA meter protected against overloads.

Power Supply: The instrument is entirely self-contained and operates on 100-125 volts, 50-60 cycles. Total consumption, 40 Watts.

Dimensions: 4 7/8" High x 5 5/8" Wide x 9 7/8" Long.

Weight: 12 pounds.

NO. 1010 COMPARISON AND LIMIT BRIDGE

USES

This instrument is a comparison and limit bridge for use in both laboratory and production testing of resistors, condensers and inductors. The manufacturer of these components can use it for production tests, the user for incoming inspection and acceptance tests. The instrument is particularly useful for laboratory work (bridge or filters) where very accurate components are required.

FEATURES

For precision and production testing, the bridge has many advantages. Power line operation and the visual indicator make the instrument completely self-contained. It can be used in noisy locations. Its small size and light weight permit the instrument to be moved easily and to be set up wherever necessary.

SPECIFICATIONS

1–Frequency: Three frequencies are available: 50 – 60 cycles, 1000 cycles, and 10,000 cycles.

The 50 or 60 cycles are taken from the line. The 1000 and 10,000 cycles are generated by an oscillator and are accurate to within 10%.

2–Range: Two comparison ranges are provided: 10% and 20%. They are selected by a rotary switch. In the 10% position the percentage is read directly on a calibrated dial. In the 20% position the reading of the dial is multiplied by two.

3–Resistor Measurements: Resistors from 10 ohms up to 1 megohms are measured by the comparison method at 60 cycles. Resistors of greater value than 1 megohm can be measured by using the instrument as a limit bridge.

4–Condenser Measurements: Condensers from 500 micromicrofarads up to 10 microfarads are measured by the comparison method at 1000 cycles. Condensers above 10 microfarads are measured by the comparison method at 60 cycles.

RCA TEST EQUIPMENT

NEW 5" OSCILLOSCOPE (WO-88A)

HIGH GAIN . . . WIDE BAND . . . DIRECT COUPLED

The WO-88A is a ruggedly built and designed instrument, engineered by RCA to give most stable performance under the rigors of continuous production-line duty. Factory, shop, and laboratory will find this 'scope reliable in a wide range of applications including: industrial maintenance and trouble shooting, general wave shape analysis, square wave testing, frequency response tests on audio amplifiers, peak-to-peak voltage measurements tracing vacuum-tube characteristics, and television servicing.
The outstanding feature of the WO-88A is its remarkably true square-wave response, obtained by adequate band-width, negligible phase shift, and a complete absence of peaking circuits. The two-stage, push-pull dc vertical amplifier has a frequency response flat from 0 to 100 Kc, thus assuring excellent reproduction of sync pulses and other complex waveforms. A sensitivity of 25 millivolts rms or better permits use in low-level circuits where high gain is needed. Hum-pickup and other undesirable "noise" is minimized by shielded input circuits, CRT gun shield, and all-steel case. Green graph screen scaled directly in peak-to-peak-voltage. A frequency compensated and voltage-calibrated step attenuator maintains uniform response over a wide range of input signal levels. Approximate trace expansion of 2 X screen diameter . . . in conjunction with 5" CRT permits detailed observation of small sections of waveforms.

The MYCALEX Story

SINCE 1919 — MYCALEX — AIRE-IN SULATOR — TRADE MARK REG. U.S. PAT. OFF.

The mining and production of sheet and block mica results in the accumulation of large amounts of scrap mica which, though free from impurities, for long had no commercial use. Shortly after World War I, Percy B. Crossley, a young chemical engineer employed by Hoare Miller & Co., the well-known British-Indian firm, endeavored to find some use for the mountains of mica which had accumulated over the centuries that mica has been mined in India.

After many unsuccessful experiments, Crossley discovered that if high grade powdered mica were mixed with the proper grades of powdered electrical glass and the mixture fused under tremendous pressure at an extremely high temperature, the ensuing plastic material, if cooled under proper pressures and conditions, would form a new composition which inherited all the insulating advantages of both materials and yet eliminated the lack of homogeneous structure of mica sheets and the brittleness of glass.

This glass-bonded mica material was found to combine all the advantages of its constituents — low loss factor, high dielectric strength, imperviousness to water and oil, perfect resistance to extremely high temperatures and humidity, freedom from carbonization, dimensional stability—together with other surprising, and useful, characteristics, such as its ability to be machined and molded to close tolerances.

Crossley's ingenious invention was granted basic patent protection and Mycalex Company, Ltd. was organized in England to develop and market the new glass-bonded mica insulation. This organization issued non-exclusive licenses in the United States to the General Electric Co. in 1923 and to the Westinghouse Electric Corporation in 1930, and to companies of comparable standing in other countries. In 1931 the Mycalex Corporation of America was formed, with 50% of the stock owned by the Mycalex Company, Ltd. and was given exclusive licenses under the English company's patents and improvements, subject only to the existing non-exclusive licenses previously granted to General Electric and to Westinghouse. Mycalex Corporation of America, which became wholly American-owned in 1941, is thus heir to the original methods, formulations, and developments of the English company—accumulated knowledge which goes back to 1919, well over thirty years.

In 1942, Mycalex Corporation of America, which had been importing Mycalex glass-bonded mica sheets and rods from England, commenced its own manufacturing operations. The initial formulations were those of the English company; but the Mycalex Corporation's own intensive development program soon led to the production of superior and special types of glass-bonded mica materials.

Mycalex 400 was developed as an all-purpose glass-bonded mica insulation particularly suited for high frequency use and was brought to its present high level of quality and performance in May, 1944. It was the first compression-molded glass-bonded mica dielectric to receive Grade L-4A ASESA approval.

Mycalex K-10 was manufactured in 1943 to meet the urgent demands of the Navy for a capacitor dielectric that not only possessed all the advantages of the best ceramic materials but could also be machined or molded to close tolerances.

In 1944, the introduction of injection-molded Mycalex 410 filled the great need of the electrical industry for a non-organic insulation that, while possessing all the advantages of Mycalex glass-bonded mica, could also be molded to close tolerances and in which metallic inserts could be incorporated.

New injection-molding equipment and techniques were developed in 1944, to make possible the injection-molding of Mycalex 410 in production quantities. Our continuing progress in this field now makes possible large-scale production of insulators whose designs represent a degree of intricacy undreamed of only a few years ago. Mycalex 410X was perfected and introduced in 1949. This leadless formulation of glass-bonded mica is valuable in the many applications where, though the loss factor need not be as low as Grade L-4, all the other characteristics of Mycalex 410 are desired. Among the special advantages of this injection-molded material are its lower density (30% less) and its lower cost — a superior insulation which, in volume production, is competitive in price with general purpose phenolics.

An Important Statement

Occasionally, engineers and purchasing executives ask questions as to the relationship of the MYCALEX CORPORATION OF AMERICA to other companies manufacturing glass-bonded mica insulation under other trade-names, and as to the proper use of the words "Mycalex" and "glass-bonded mica". Here are the answers to the most frequently asked questions:

1. The MYCALEX CORPORATION OF AMERICA is not connected or affiliated with any other company manufacturing or distributing glass-bonded mica insulation materials, except Mycalex Electronics Corporation and Mycalex Tube Socket Corporation. These "Mycalex" companies are exclusively licensed by the Mycalex Corporation of America to distribute Mycalex glass-bonded mica components.

2. The word "MYCALEX" is not a generic term. "Glass-bonded mica" is the generic or common name of the material. "Mycalex" is a trade-mark registered in the United States Patent Office, and owned by the MYCALEX CORPORATION OF AMERICA, and identifies the glass-bonded mica products of formulae and design developed and manufactured in the plant of the MYCALEX CORPORATION OF AMERICA.

3. The General Electric Company, by virtue of a non-exclusive license it had under a MYCALEX patent through the MYCALEX COMPANY, LTD., of Great Britain, has been permitted to identify its glass-bonded mica insulating materials made under such license as "G-E Mycalex."

4. All products of the MYCALEX CORPORATION OF AMERICA are given distinctive identifications incorporating the trade-marked name "Mycalex", such as "MYCALEX 410", "MYCALEX 410X", "MYCALEX 400", and "MYCALEX K". The role of Mycalex glass-bonded mica in the advanced electronic devices of tomorrow is not dependent upon a few outstanding advantages. The main reason for the success of Mycalex is its unique ability to combine all the important characteristics required of a thoroughly modern, permanently efficient insulating material. In Mycalex, every one of the eight desirable qualities featured below is incorporated into a single powerful unit. Thus Mycalex—with its invaluable combination of attributes—offers a dynamic challenge to designers of electrical and electronic devices: a challenge to the development of new techniques, new ideas, new products. American ingenuity has been quick to take advantage of this highly efficient insulating material. Mycalex is influencing advanced trends of invention, and the future holds a wealth of untapped potentialities. The table below shows at a glance how Mycalex compares with other insulating materials. It is evident that Mycalex leads the list with 91% of the requirements for an ideal insulator.

DIMENSIONAL PRECISION AND STABILITY — Where accuracy of dimensions is important, Mycalex is invaluable because it does not warp. Sheets maintain their original flatness and size. Machined forms hold their shape indefinitely. This quality of "unwarpability" makes Mycalex useful in many applications where other materials fall short.

MACHINED OR MOLDED TO CLOSE TOLERANCES Although a hard vitreous material, Mycalex can be machined or molded to close tolerances: thicknesses of ±0.001 inch on flat strips up to about 100 square inches in area; diameters of ±0.001 inch on rods and for reamed holes, ±0.002 inch for drilled holes.

RESISTANCE TO HIGH TEMPERATURE AND HUMIDITY — In modern worldwide electronics, tropical temperature and humidity create new problems which many insulating materials cannot meet. Mycalex, however, retains its original physical and electrical properties under conditions of extreme temperature and humidity.

LOW LOSS FACTOR — Mycalex glass-bonded mica has a lower loss factor than any other material except a few of the steatites, glasses and thermo-plastics. The low loss factor not only means less loss of electrical energy but more stable circuit characteristics at high frequencies. The loss factor of Mycalex 400 is only 0.015 at one megacycle after 48 hours immersion; that of Mycalex 410 is 0.014.

HIGH DIELECTRIC STRENGTH — In dielectric strength, Mycalex matches most thermoplastic organic insulations; probably outstrips phenolics and laminates; and definitely surpasses steatites and porcelains. While many conditions cause variations in dielectric strength, the average for Mycalex is 500 volts per mil for ¼ inch thickness.

HIGH FLEXURAL STRENGTH — Mycalex has a flexural strength of 15,000 to 20,000 psi: 25% lower than the best phenolic laminates; equal to many laminates; only 10 to 15% lower than steatite. The high flexibility of Mycalex enables it to withstand a greater degree of bending or vibration than any other vitreous material.

FREEDOM FROM CARBONIZATION — Any insulator which is susceptible to carbonization in case of arcing is seriously handicapped. Many organic plastic materials are restricted by this drawback. Mycalex, however, is free from this limitation — due to the absence of any ingredients which can carbonize.

IMPERVIOUS TO WATER, OIL — Mycalex glass-bonded mica does not absorb water. It has no reaction with oils or any organic solvents. Mycalex, therefore, does not have the surface leakage found in many other insulators. The smoother the insulator surface, the less moisture it retains.

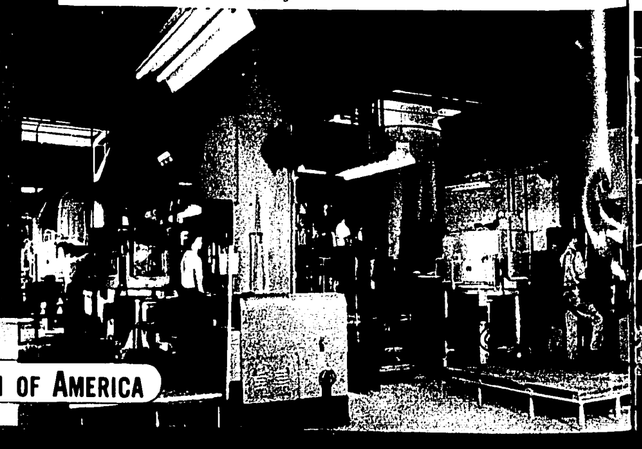
Injection-Molded Grades

Precision Molded to Size

MYCALEX 410 Glass-Bonded Mica

An injection-molded material (molded in transfer-type molds) of great versatility in design. It is an all-purpose low-loss insulation suitable for use over the whole range from power frequencies to ultra-high frequencies. Arc resistance and dielectric strength are high; mechanical strength is good. A variety of metals may be incorporated directly into the insulators during the molding operation. Mycalex 410 meets all the requirements for Grade L-4B under Joint Army-Navy Specification JAN-I-10. (Qualification Approval Certificate #ASESA-13385 dated 21 February '51.)



MYCALEX 410X Glass-Bonded Mica

This grade is an injection-molded type intended for the field of applications occupied by general-purpose phenolics and similar materials. Its cost is competitive but the electrical properties are much superior. The safe operating temperature is high. It is completely inorganic and therefore has excellent arc resistance. Mycalex 410X weighs approximately 30% less than Mycalex 410.

MYCALEX KM Glass-Bonded Mica

Type KM is the injection-molded counterpart of Mycalex K. Higher dielectric constants can be obtained with the KM materials, and metal inserts can be molded directly into the dielectric.

Ultra modern production machines like this battery of high speed molding presses assure efficiency and economy in manufacturing.

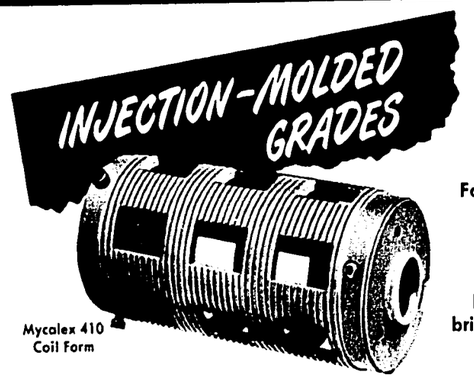
Compression-Molded Grades

Sheet and Rod for Fabrication

MYCALEX 400 Glass-Bonded Mica

A machinable type of Mycalex available as sheets or rods or as insulators machined to specifications. This type of material has low dielectric losses over a large portion of the frequency spectrum. The dielectric strength is high, arc resistance is good, and mechanical strength is satisfactory for all except unusually severe requirements. Mycalex 400 is used extensively in electronic circuits, especially at high frequencies. It is fully approved as Grade L-4A insulation under Joint Army-Navy Specification JAN-I-10. (Qualification Approval Certificate #ASESA-13332 dated 14 February '50.)

Mycalex 400 glass-bonded mica can be readily machined using regular machine shop equipment. This low-loss insulator can be cut, drilled, tapped, threaded, flycut, slotted and ground. Finishing and polishing require only the usual abrasive wheels found in the average plant. Machining and fabricating techniques are discussed fully on Page 14.



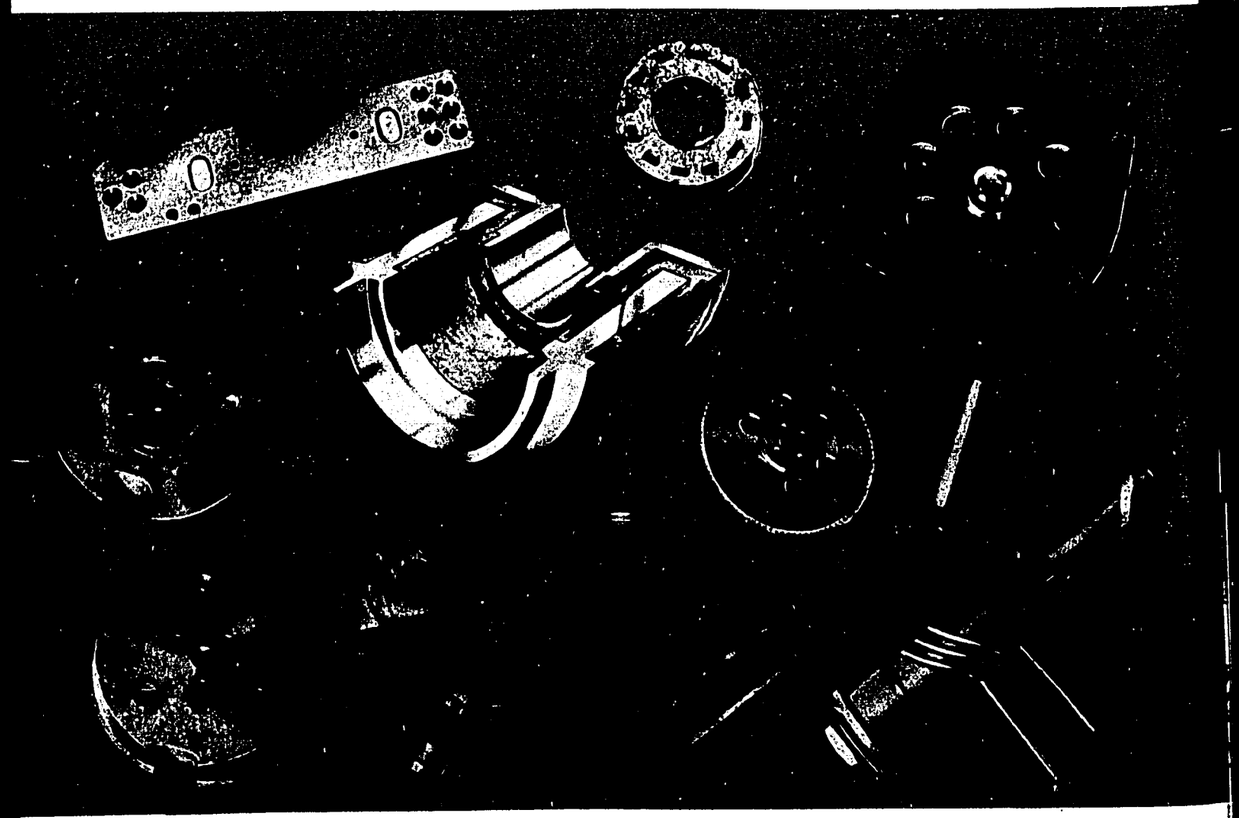
For applications and forms available, refer to Page 12.
Complete electrical and mechanical data, on Page 13.

MYCALEX K Glass-Bonded Mica

A machinable capacitor dielectric which is manufactured to special order. Dielectric constants of 10, 15 and 20 at one megacycle can be produced. Dielectric strength and arc resistance are good. Mechanical strength is satisfactory.

Precision lathes and millers occupy a corner of the tool room where all Mycalex production tools are made.

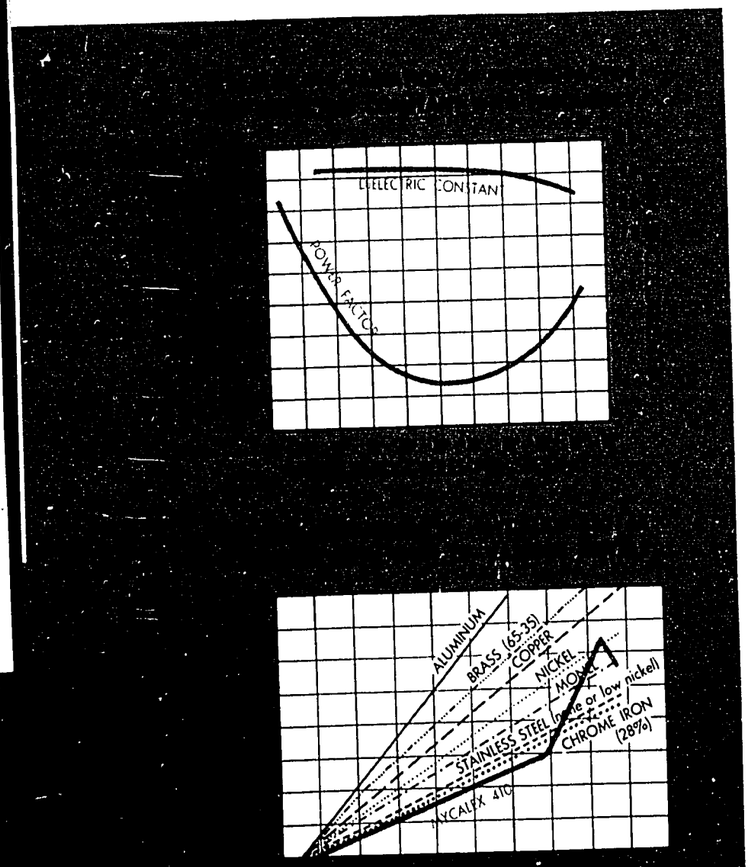
Mycalex 410
Coil Form



Mycalex 410

For many years there existed in the electrical and electronic industries a great need for an inorganic insulation which could be molded to close tolerances and which could incorporate metallic inserts when necessary. Sporadic attempts to fill this need resulted in some small success but it remained for the Mycalex Corporation of America to bring the product to the present high degree of development.

The variety of shapes possible with Mycalex 410 glass-bonded mica is remarkable; and when this varied geometry is coupled with very low dielectric losses over the electromagnetic spectrum from 60 cycles per second to 24,000 megacycles per second, an insulation of unusual versatility results.

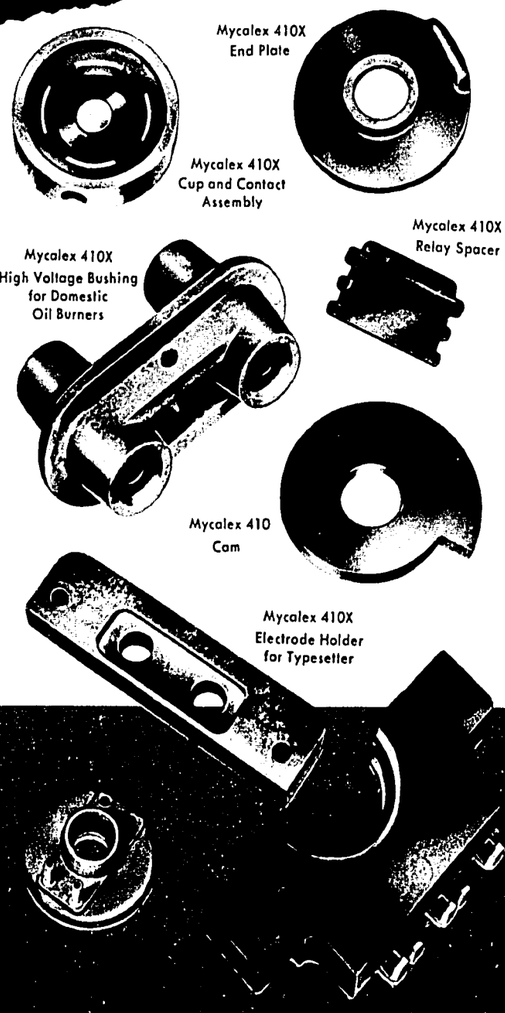


There are no fillers or plasticizers in Mycalex 410. The ingredients consist solely of mica of the highest quality and a special glass, developed for the purpose, as the matrix in which the mica is carried. Mica, however, is not simply dispersed in the glass. There are selective chemical reactions, with consequent chemical bonding, which occur at the interfaces of glass and mica; and these bonds give a degree of strength and electrical excellence not obtainable when one phase is merely dispersed throughout another.

Mycalex 410 cannot be undercured or overcured, as in the case of organic plastics. The necessary time in the mold is only that required for the material to become rigid through drop in temperature. Hence, there are no changes of any kind which could produce distortions. The precision dimensions molded into a Mycalex insulator are the dimensions which remain indefinitely so long as the material is not heated above 650°F. Mycalex 410 products have complete dimensional stability.

Data and Specifications

SINCE 1919 MYCALEX THE INSULATOR TRADE MARK REG. U. S. PAT. OFF.



● Mycalex 410 glass-bonded mica is a precision molded inorganic insulator with very low dielectric losses. It fills an obvious need at all frequencies and particularly in the high frequency bands. Mass produced high frequency products require close tolerances, both on dimensions and electrical properties. Mycalex 410 has a loss factor of 0.014 at one megacycle after immersion for 48 hours in water, and is therefore classifiable as Grade L-4 insulation.

● Electrically, then, it may be considered the injection-molded counterpart of Mycalex 400. Mycalex 410 lends itself to precision molding at high production rates in multi-cavity molds. It is consequently a most desirable insulation for all parts which are required in large quantities, for example, miniature and subminiature tube sockets, relay spacers, television tuner components, etc.

● Dimensional reproducibility with close tolerances is inherent in Mycalex 410 insulators, and this material should be considered for all applications where such precision is necessary. Mycalex 410 may be used to supersede mineral-filled, alkyd, and similar organic insulations which have been used extensively in the past. Improved production techniques have put Mycalex 410 within the cost range of less desirable materials.

It is now possible to substitute Mycalex 410 directly for phenolics, alkyds, melamines, and similar less effective molded organic insulations.

INJECTION-MOLDED GRADES (CONTINUED)

There is a large field of applications where good electrical characteristics are desirable but where the loss factor need not be so low as to place the insulation in the Grade L-4 category. Certain economies and reduced weight result from these less stringent electrical requirements. Nearly all other characteristics of the low-loss materials are retained. Mycalex 410X glass-bonded mica is the only moldable insulation of this type.

Mycalex 410X permits increased latitude in formulation, and as a result of this factor the composition has been so adjusted as to produce a considerably lower density—about 30% lower than that of Mycalex 410. All mechanical properties, arc resistance, resistance to heat distortion, etc. are comparable in both cases.

Because of the above factors Mycalex 410X can be produced at a cost low enough to permit its direct substitution in place of general-purpose phenolics and other organics. A much superior insulation is thus obtainable at competitive prices. The loss factor of Mycalex 410X is only about one-fourth of that of general-purpose phenolics. Its greater arc resistance, high dielectric strength, negligible water absorption, and dimensional stability offer still further advantages to the purchaser of Mycalex 410X.

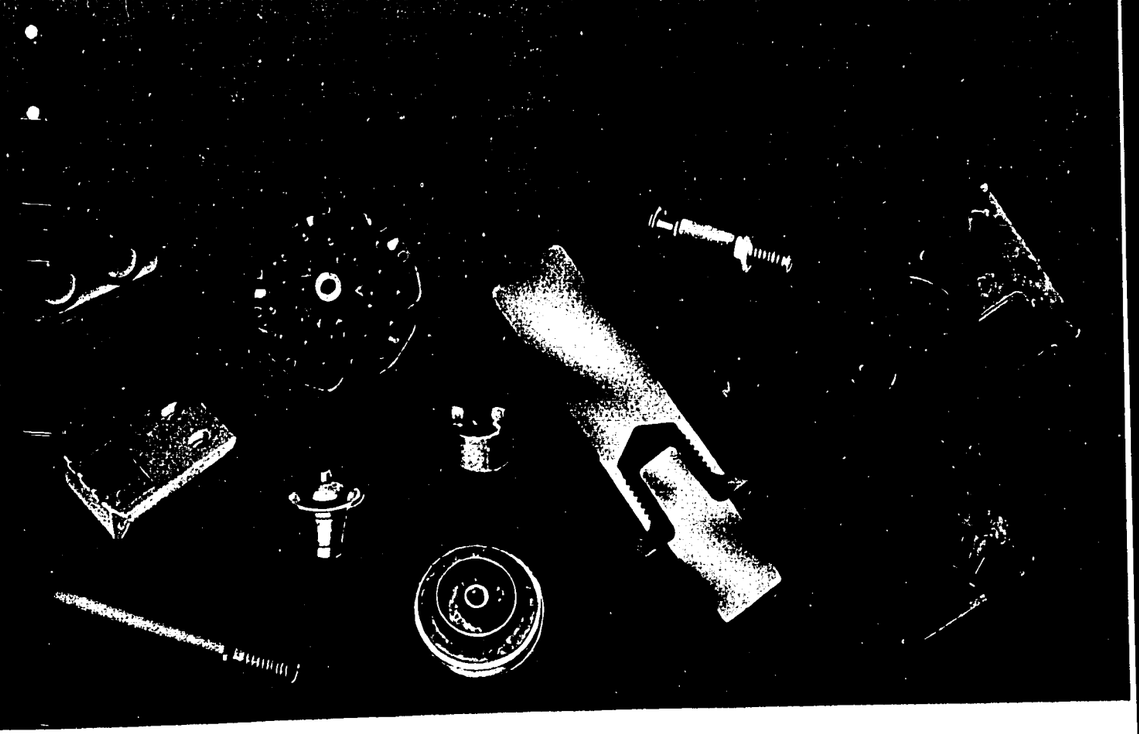
SINCE 1919 MYCALEX THE INSULATOR TRADE MARK REG. U. S. PAT. OFF.

● **GENERAL DESIGN** — Good plastic flow is desirable for best results. Rounded corners and gradually changing contours permit the material to fill the mold in the shortest possible time.

● **HIGH VOLTAGE** — A special report covering the design of Mycalex high voltage components is available upon request.

● **THICKNESS** — It is rarely practicable to mold insulators thinner than 1/16 inch. Short tubes of small diameter (about ¼ inch) have been molded with wall thickness of 0.030 inch; but the wall thickness must be increased when the length exceeds about ¾ inch. Walls should be as nearly uniform in thickness as possible.

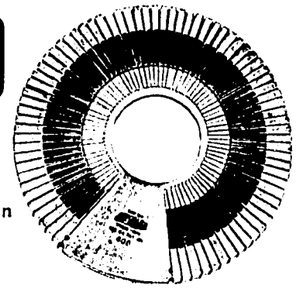
● **TAPER** — Mycalex 410 and Mycalex 410X shrink at the same rate as the mold in cooling. It is necessary, therefore, to allow a rather generous taper on all vertical surfaces. Liberal radii on corners and edges are also essential. Normally, a wall taper of ½° is recommended (about 0.008 inch per inch) to permit easy ejection. For small parts, where the entire bottom of the mold cavity may serve as a knockout pin, and where the thickness of the part is not greater than 1/16 inch, as little as 0.002 inch per inch taper may be permissible.



● **FLATNESS** — Flatness is generally about 0.003 inch per inch

rates, increase rejects, and consequently increase cost. Loose wedges, which are used in other plastic molding, are difficult to employ with Mycalex glass-bonded mica because of the high mold temperatures involved, but can be used when necessary.

● **HOLES** — The distance between holes should be a minimum of ⅛ inch, and the distance from the edge of a hole to the edge of the insulator should be a minimum of 1/16 inch. For large holes it is well to increase this latter dimension.
In general, the depth of a hole should be not greater than one and one-half its diameter. For small diameter holes, the pin breakage becomes excessive if the length is too great.



● **TOLERANCES** — Very close tolerances can be held if necessary, but the cost will, of course, go up in proportion. Normal tolerances are: ±0.002 inch on length or width up to 1 inch; 0.005 inch on length or width up to 2½ inches; 0.010 inch on length or width up to 5 inches; ±0.003 inch on hole centers up to 1 inch; ±0.005 inch on hole centers over 1 inch; ±0.5° of arc on hole centers for holes arranged in circle; ±0.003 inch on radius up to 1 inch for holes arranged in circle; ±0.005 inch on radius up to 3 inches for holes arranged in circle; ±0.005 inch on thicknesses (dimension perpendicular to parting line of mold).

● **INSERTS** — Metal inserts are normally anchored into Mycalex glass-bonded mica by grooving, thread-

Mycalex 400

Mycalex 400 is an all-purpose glass-bonded mica insulation particularly suited for high-frequency use.

Even at 10^{10} cycles, the loss factor of Mycalex 400 is well within requirements for operation in this portion of the electromagnetic spectrum. An outstanding characteristic is the long frequency range over which the loss factor is a minimum.

With a background of steady development since 1919, Mycalex 400 in its present form was brought to fulfillment in May 1944. It is one of the most highly developed and efficient insulating materials on the market today.

● **HIGH VERSATILITY** — One of the advantages of Mycalex 400 glass-bonded mica is its unusually fine and uniform texture. This feature not only enhances strength and ability to withstand vibration, but improves machinability. As a result Mycalex 400 can be machined into a wide variety of complex shapes.

● **APPLICATIONS** — There is almost no limit to the exacting uses to which Mycalex 400 can be put. In tropical climates its excellent electrical and physical properties are unimpaired. Prominent among the many devices for which Mycalex 400 provides adequate insulation are radio transmitters, radio receivers, panels for radio applications, switchboard panels for coal mines, arc shields in high-tension switches, relay contact supports, brush holders, and X-ray equipment.

● **FORMS AVAILABLE** — Mycalex 400 glass-bonded mica is made in sheets 14 x 18 inches; ordinarily in thicknesses of 1/8 to 1 inch; on special order in thicknesses of 3/32 and 1/16 inch. Rods 18 inches long have diameters from 1/4 to 1 inch. (See page 13 for a table of the standard sizes of Mycalex 400 sheets and rods which are available from stock.)

Production lathes of tool room accuracy perform one step in fabricating Mycalex glass-bonded mica to the highest precision standards.

COMPRESSION-MOLDED GRADES (CONTINUED)

● **MACHINING** — In machining Mycalex glass-bonded mica, ordinary machine shop equipment may be used; tungsten carbide tools are preferable when available; also a generous supply of water for a coolant and lubricant is important. It is usually advisable to work across the grain of the material, as this procedure does not call for so much care. The following methods are recommended for performing the various machining operations:

● **CUTTING** — Three methods are recommended. For thicknesses up to and including ⅜ inch use band saw with 12 teeth per inch and speed of about 1100 feet per minute. Rough edge may be finished on wet sanding belt. Another method is the use of resinoid-bonded silicon carbide wheel ⅛ inch thick, or rubber-bonded silicon carbide wheel 1/16 inch thick. 2700 to 3300 rpm. Water for coolant and lubricant applied in steady stream. For thicknesses from ½ to 1 inch use Rimlock diamond wheel (Felker Di-met), 8 to 10-inch diameter, heavy duty. 2000 to 2500 rpm. Steady stream of water for coolant and lubricant.

● **DRILLING** — There are two recommended methods. Use high-speed steel drills (to be touched up after every 3 or 4 holes). Double-plate drill jig most satisfactory. Copious supply of water. Drill part way through; turn piece over; drill from other side. Diameters up to ¼ inch: 1500 rpm; ¼ to ½ inch: 900 rpm; over ½ inch: decrease speed accordingly. The preferred method; however, is the use of drills of tungsten carbide, Carboloy 44-A or Firthite HA. Drill from both sides. Diameters up to ¼ inch: 2500 rpm; ¼ to ½ inch: 1500 rpm; over ½ inch: decrease speed accordingly.

● **THREADING** — There are two good methods. On lathe with tool-post grinder, use fine-grain silicon carbide or aluminum oxide wheel with V-edge. The second is the use of tungsten carbide tool, and chasing thread as with metals. May also be used for internal threading if hole is sufficiently large. Water as lubricant preferred.

● **TAPPING** — Use high-speed steel tap with long lead. Countersink both ends of hole before tapping. Use water as lubricant. Gives Class 1 fit with 60 to 70% of thread obtained on metals.

● **FLYCUTTING** — Use tungsten carbide tool at slow speed. Cut halfway through; reverse piece; cut from other side. Use at least ¼ inch diameter pilot hole. Copious supply of water as lubricant.

● **SLOTTING** — There are three methods of slotting. The use of metal-bonded diamond wheel of proper width on cutter or milling machine. Silicon carbide wheel may be used, but is less satisfactory. Water as lubricant. A second method is the use of milling cutter, preferably tungsten carbide tipped. Water preferred as lubricant. The third method is to use shaper with tungsten carbide tool bit. Take small cuts, about 0.005 inch. Water preferred as lubricant.

● **GRINDING** — For flat surfaces. On any surface grinder (Pratt & Whitney, Landis, Portman, Blanchard, Besley) use silicon carbide resinoid-bonded wheels at speeds recommended by manufacturer. Use soft coarse-grained wheel for heavy grinding; hard fine-grained wheel for polishing. Copious supply of water as lubricant. For round rods — Use centerless grinder. In grinding it is desirable to use 50 gallons of soluble oil per 5,000 gallons of water for longer grinding wheel life.

● **FINISHING EDGES OF ROUND DISCS** — There are three methods. Use resinoid-bonded silicon carbide wheel with tool-post grinder on lathe. Run at slow speed. Finish each disc separately or place several discs on mandrel. Continuous stream of water as lubricant. Another method is the use of tungsten carbide tool bit on lathe. Follow above method. A third, the use of wet sanding belt with suitable holder.

● **LATHE OPERATIONS**—Two methods are recommended. Use tool bits of Carboloy No. 883 or Firthite grade HA. Water preferred as lubricant. Use wheels of silicon carbide on tool-post grinder. Water is preferable as a lubricant.

● **CEMENTING "MYCALEX 400" AND "410"** — "Araldite* CN502 or CN503" ethoxyline resins may be used for bonding Mycalex to other plastics, ceramics, metals, etc. The resulting high strength bond will be heat resisting to about 300F. "Sauereisen"† adhesive cement will also produce a satisfactory high-temperature bond between Mycalex and metals, glass, plastics, etc. "Cycleweld"§ is also a satisfactory adhesive.

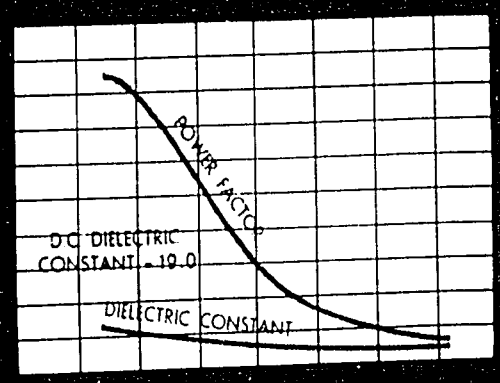
NOTICE: to former "G-E Mycalex" customers for fabricated parts and standard shapes of compression-molded glass-bonded mica

In October, 1949, the Mycalex Corporation of America purchased from General Electric Co. (which then discontinued the Fabricated "G-E Mycalex" Insulation Division at Taunton, Mass. that it had been operating since 1923) G-E's entire stock of standard sizes of sheets and rods made of compression-molded "G-E Mycalex". However, the General Electric Co. continues its custom-molding "G-E Mycalex" operations, having discontinued only the Fabricated "G-E Mycalex" Insulation Division.

Mycalex Corporation of America also underlook, in connection with such purchase, the supplying of compression-molded Mycalex glass-bonded mica both in standard shapes and fabricated to order, to G-E's former customers and to G-E directly, the General Electric Co. recognizing that the Mycalex Corporation of America, by virtue of experience dating back to 1919, its up-to-date facilities, special equipment, and "know-how", was best able to satisfy all such requirements.



To expedite the filling of orders, all inquiries concerning such stock shapes and fabricated parts should be addressed to Mycalex Corporation of America, Clifton Blvd., Clifton, N.J.

Design of Machined Insulators

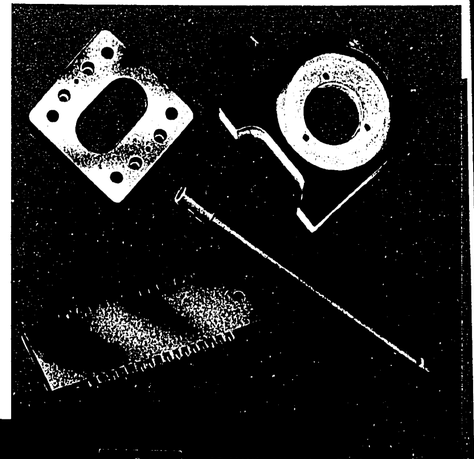
1. PREFERRED SHAPES.—To provide maximum production, reduce fabrication time, and reduce costs, it is recommended that rectangular parts be used where possible and that irregular or curved sections be avoided.

2. TAPPED HOLES.—Although holes in glass-bonded mica insulation can be tapped, it is recommended that such holes be avoided if possible. If tapped holes are required, they should be slightly countersunk to prevent chipping.

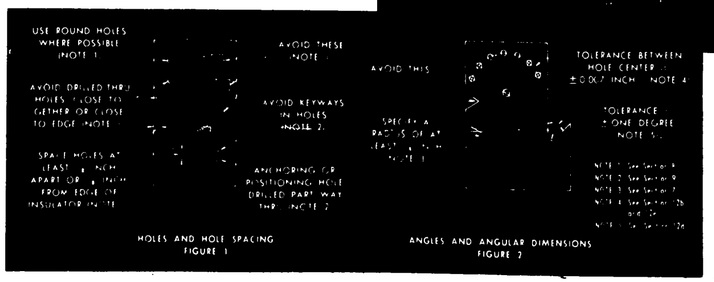
2a. Bottoming of tapped or blind holes should be avoided.

2b. Threads in tapped holes should conform to Class 1 fit as outlined in Screw-Thread Standards for Federal Services, 1942 (NBS Handbook H28).

3. COUNTERBORING.—Although it is possible to counterbore glass-bonded mica, it is not always possible to secure sharp edges around the counterbore.



4. THICKNESS OF FLAT PARTS.—Flat plates or sheets from which most parts are fabricated are available in standard thicknesses of ⅛, 3/16, ¼, ⅜, ½, ⅝, ¾, ⅞, and 1 inch. In the design of flat parts, standard thicknesses should be specified wherever possible. It should be noted that the nominal minimum thickness of flat parts is ⅛ inch. Although thicknesses less than ⅛ inch can be produced, special grinding operations involving high cost and increase in production time are required. In any case, the thickness should be not less than 3/32 inch where the maximum dimension (length or width) of the part is 3 inches. For dimensions above 3 inches, the minimum thickness should be ⅛ inch.



5. ROUND RODS.—Round rods are available in standard dimensions of ¼, ⅜, ½, ⅝, ¾, ⅞, and 1 inch. In the design of parts to be machined from rod stock, such as bushings, washers, or spacers, standard diameters should be specified wherever possible. (See 12g next page.)

6. CORNERS.—On flat plate designs, right-angle outside corners should be specified where possible to avoid additional time-consuming machining operations. Where it is essential that sharp outside corners be eliminated, a chamfer should be used in place of a definite radius, as the latter requires the use of special jigs. (See Fig. 3.)

7. ANGLES.—Where angles or "V" cuts are required in the edges of flat pieces, a radius of not less than ⅛ inch should be specified at the apex of the angle or "V" cut. (See Fig. 2.)

8. HOLES.—Round holes should be specified in preference to square, rectangular, or elongated holes as the latter involve costly, time-consuming machine operations. The distance between edges of holes and between an edge of the insulator and the edge of a hole should be not less than ⅛ inch. (See Fig. 1.)

9. KEYWAYS IN HOLES. — The machining of keyways, slots, or notches in holes is costly and time-consuming since milling, grinding, or filing operations are required. Alternative methods of anchoring metal parts should be considered by the designer. A small hole close to the main mounting hole may be used to receive an anchoring or positioning pin. Such small holes are usually drilled partially through the insulator. If a keyway is essential, a radius of 0.032 inch should be allowed on the inside corners. (See Fig. 1.)

10. BUSHINGS. — The wall thickness of bushings should be not less than as shown in Table III.

TABLE III

MAXIMUM BUSHING LENGTH (inch)	OUTSIDE DIAMETER (inch)	MINIMUM PERMISSIBLE WALL THICKNESS (inch)
1/4	Up to 3/8	1/16
1	Up to 1/2	1/8
1	1/2 to 3/4	3/16
1	3/4 to 1	1/4

11. SLOTTED BARS.—A radius of 0.032 inch should be allowed on the inside corners of slots cut in the edge of parts. (See Fig. 4.)

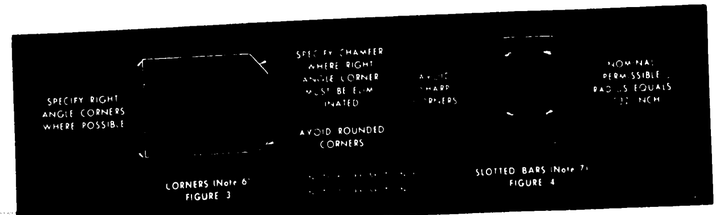
12. TOLERANCES.—In general and unless otherwise specified, the following tolerances should apply to all dimensions of insulators.

12a. Overall Dimensions (Length, Width, and Thickness.)—The tolerance for any overall dimension shall be in accordance with Table IV.

12b. HOLE SPACING.—A tolerance of ±0.007 inch shall apply to dimensions for distances between hole centers and distances from hole centers to reference edges or reference lines. Although it is possible to fabricate to closer tolerances, such tolerances involve special fabricating tools and technique and should therefore be avoided unless essential. (See Fig. 2.)

TABLE IV

LENGTH (inches)	TOLERANCES (±inch)		
	Length	Width	Thickness
Up to 16	1/64	1/64	1/64
16 or greater	1/64	0.020	1/64



12c. HOLE SIZE.—Standard tolerances for all hole diameters shall be ±0.005 inch for all diameters up to 0.5 inch, then ±1 per cent of hole diameter for all diameters 0.5 inch and greater.

12d. ANGULAR DIMENSIONS.—Where angles or "V" cuts are required in the edges of flat pieces, the tolerance on such angular dimensions shall be ±1 degree. (See Fig. 2.)

12e. Where angular dimensions are specified for the layout of holes, the tolerance on dimensions between hole centers shall be ±0.007 inch. It is recommended that the chord distance between hole centers be indicated on drawings to assist in the layout of hole centers. (See Fig. 2.)

12f. FLATNESS.—Where flatness limits are not indicated on the drawing or specification, the limit shall be 0.0015 inch per inch of length for any dimension.

12g. DIAMETER OF RODS.—A tolerance of ±0.005 inch shall apply to the diameter of all round rods.

MYCALEX MODEL TM51 SERIES— This Mycalex Telemetering Switch was designed to meet the need for a precision-built motor-driven commutating switch of greatly reduced size capable of long-life, trouble free service. The heart of this switch is the commutator plate injection-molded of Mycalex 410 glass-bonded mica insulation. This material not only insures permanent dimensional stability but provides a very tenacious bond to the metal inserts.

There is no loosening of contacts after repeated soldering or under continuous temperatures of 650°F or short time exposures to 1500°F. Nor is there any resistance change. The commutator shows absolute age and dimensional stability with no distortion or change in 100% humidity. High acceleration loads and vibrational fields produce no ill effects.

MYCALEX 410 TELEMETERING COMMUTATOR is a mechanical production achievement. The following data offer convincing evidence that this commutator plate is a great accomplishment in precision fabrication. Its dimensional accuracy and functional efficiency are a combination that could probably not be duplicated in any material other than Mycalex 410.

The contact rings have 60 contacts per ring. Contact spacing is held to 6° ±1 minute and the center lines of the contact and annular rings are held to within ±.001". The assembly height from the face of the slip rings and contacts to the Mycalex 410 glass-bonded mica insulation is held to +.002", −.000". The contact ring and slip ring surfaces however are finished to a flatness of 5 microinches by lapping to attain precision, low noise level switching, and a very high degree of sampled channel uniformity.

Motor — Motors and gear reduction units are presently available for operation on 6, 12 or 24 volts dc or 400-cycle ac with rectifier supplied. The gear reduction units are tailor-made, using brass gears and stainless steel pinions. All bearings are precision-micro type. Gear centers are located with a jig borer for extreme accuracy. All fastenings are of stainless steel.
Units will be available with a variety of motor types, and capable of operation at speeds from 60 rpm to 1800 rpm.

Dimensions — Total weight—12 oz. (without rectifier). Rectifier weight—1⅛ oz. Mounting — May be clamped in position or held with screws tapped into aluminum housing. Motor is offset to provide maximum space factor. May be mounted in any position. Units which are to be operated under high accelerated fields should be mounted so motor axis is in line with the direction of acceleration.

Contacts — Silver contacts are carefully lapped to extreme smoothness and must be protected by careful handling during installation to insure maximum performance. Foreign particles — dust, solder flux, etc. — can easily damage these finely finished surfaces.

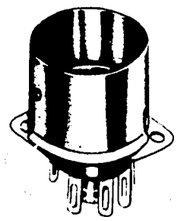
CONTACT TERMINALS The contact terminals are designed so that the inductive length is no greater than the tube pin. This is an important gain to the circuit designer. Direct ground connections to chassis by 90° bending of contact tab is possible without fracturing or weakening of the tab.



These sockets are molded of MYCALEX 410 injection molded glass-bonded mica and feature extremely low inter-electrode capacitance. Use of MYCALEX 410, with its great dimensional stability, permits a minimum amount of dielectric to be employed hence air is utilized as the insulator to a maximum degree.

In addition to many other desirable features — high arc resistance, high dielectric strength non-porosity, etc.—MYCALEX 410 has a very low dielectric loss at all frequencies including UHF and thereby offers great advantage over all phenolic dielectrics. MYCALEX 410 will operate continuously in temperatures up to 700°F with practically no change in electrical properties. Ability to withstand sustained high temperature definitely eliminates any possibility of body distortion or breakage during soldering operations.

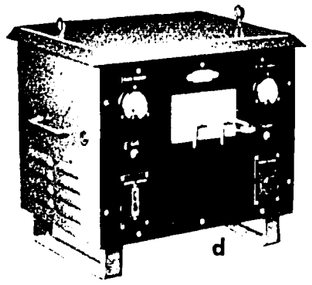
a

Although electronic heating is generally regarded as an entirely new technique and the number of manufacturers of equipment for the process is not very large, Scientific Electric enjoys the distinction of being a pioneer in the field. We are designers and manufacturers of electronic heaters of the Induction and Dielectric types; and one of the first to build any kind of equipment for this technique. For more than three decades, leading manufacturers of Electronic, Neon, X-ray, Fluorescent and Cathode Ray TV tubes, have used our custom built equipment for such operations as: Degassing, sealing glass to glass or glass to metal. And in the greater field of electronic heating Scientific Electric High Frequency Generators of all types are now performing a great variety of specific heat treating jobs—economically, faster, and with better results over all previous methods.



b

Of particular interest to the prospective buyer of electronic heating equipment is the fact that the maximum economies effected by the application of the technique to manufacturing processes, can only be realized by utilizing equipment of the correct frequency and power combination. It is significant that only Scientific Electric in the present market, can offer you a selection of frequencies depending on power required, in wide power range . . . 3½-5-6-7½-10-12½-15-18-25-40-60-80-100-125-250 KW. This means that electronic heating equipment produced by Scientific Electric is tailored to your needs . . . fitted perfectly to the task entrusted to it, enabling you to keep your initial investment in equipment to a minimum while affording you all the proven advantages of electronic heating.

In our factory showroom we are ready to demonstrate the operation of any Scientific Electric Electronic Heater in its application to your own specific heating problem. Our laboratory engineers will gladly, and without obligation, make a study of the process to which you wish to apply electronic heating. They will then make recommendations and demonstrations on the equipment best suited for your needs. Before you invest in any electronic heating equipment, you will be able to observe at first hand how your heat treating jobs can be accomplished better . . . faster . . . and more economically with Scientific Electric equipment. You will be able to estimate the actual saving in cost of operation to a degree that will make it possible to approximate the time required to amortize the cost of equipment with the savings resulting from its use.

POWERSTAT VARIABLE TRANSFORMERS

A Complete Line for every
VARIABLE A-C VOLTAGE REQUIREMENT

POWERSTAT variable transformers are autotransformers of toroidal core design with a movable brush tap which rotates to deliver a continuously adjustable output voltage from a-c power lines. Features of every POWERSTAT are excellent regulation, high efficiency, conservative ratings, zero waveform distortion, rugged mechanical construction, smooth control and standard mountings. Numerous types are available for 115, 230 and 460 volts, single and three phase operation in ratings from 150 VA to 100 KVA. Most types are offered for either manual or motor-driven operation. In the chart are listed some of the standard types. In addition, oil-cooled and explosion-proof types are available. Therefore, if one of the units listed does not suit your particular need, consult us. There's a POWERSTAT for every variable a-c voltage control requirement. The complete POWERSTAT line is described in Bulletin P550.

* These units are supplied with an "L" terminal which allows connecting in the field to limit the output voltage to the applied voltage. If "L" type connection is required on other models, the "L" must be included in the type number when ordering.

‡ When these POWERSTATS are "L" connected so that the output voltage does not exceed the applied voltage, the frequency range is 50/60 cycles.

** When a motor-drive is required, prefix the letter "M" together with the speed designation letter to the type number. Z — 6 seconds, Y — 14 seconds, X — 19 seconds and W — 45 seconds for full range travel. Since the driving motors are frequency sensitive, be sure to specify whether 50 or 60 cycles is required. Only manually-operated unit weights are listed. For motor-drives add 10, 11 and 14 pounds to the 116-216, 1126-1226 and 1156-1256 types, respectively.

VARICELL

THE IDEAL SOURCE OF LOW D-C VOLTAGE

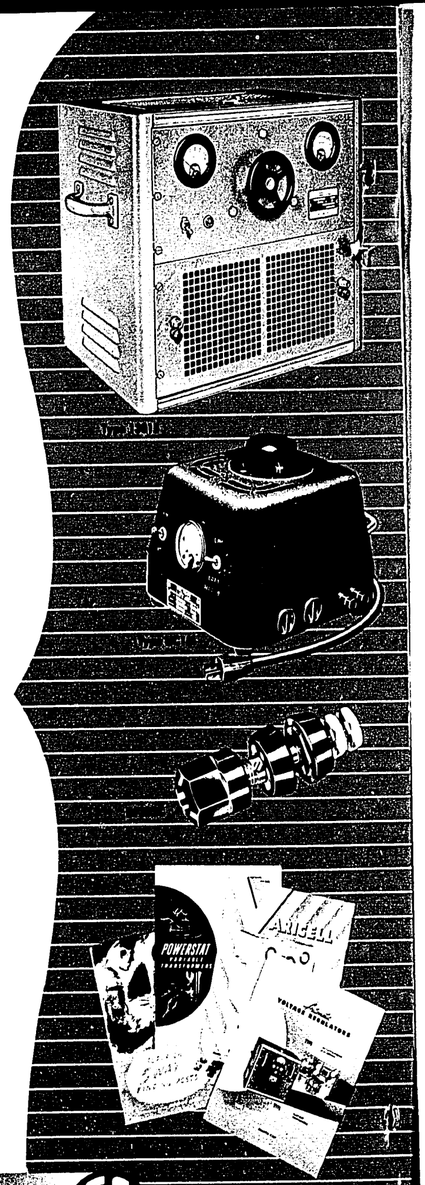
The VARICELL provides a source of stabilized-regulated adjustable low d-c voltages from a-c power lines. Essentially, its basic components are a POWERSTAT variable transformer, a fixed-ratio rectifier transformer, a saturable core reactor, a rectifier stack and an electronic control circuit. By turning a handwheel a variable range of d-c voltages is available. Any setting of output is unaffected by line voltage changes or load current variations. Type 13015, illustrated, is rated 95-135 volts, 60 cycles, single phase a-c input and 0-30 volts, 15 amperes d-c output. Stabilization and regulation is ± 0.25 volts and R.M.S. ripple voltage never exceeds 0.1 volts for the output range of 6 to 30 volts. LIST PRICE: $765.00. Complete information is given in Bulletin V1051.

VOLTBOX A-C POWER SUPPLIES

A COMPACT, PORTABLE SOURCE OF A-C VOLTAGE

The VOLTBOX is a very handy instrument for use in chemical, physical, electrical and other laboratories, the factory inspection department and the plant. It eliminates the task of collecting a variable transformer, voltmeter and connection leads when a test must be performed involving variable a-c voltage. In the VOLTBOX are all the necessary components conveniently placed for ease of operation. Various types are offered. Type UC1M, shown, is rated 115 volts, 50/60 cycles, single phase input; 0-135 volts, 7.5 amperes output. Type UC2M operates from 230 volts, 50/60 cycles, single phase to deliver 0-270 volts, 3.0 amperes. LIST PRICE: UC1M, $46.00; UC2M, $52.00. Additional types described in Bulletin P550.

SUPERIOR 5-WAY BINDING POST



INCREASED FLEXIBILITY AND SAFE POSITIVE CONNECTIONS

The 5-WAY Binding Post offers complete insulation, a current capacity of 30 amperes, and a working voltage of 1000 volts. It's easy to install. Available in black or red phenolic for polarity or circuit identification. Connections can be permanent clamping, spade lug, clip-lead, banana plug, or looping and clamping. LIST PRICE: $0.40 each. The impedance ratings are listed in standard manner. Obviously, a transformer with a 15,000 ohm primary impedance can operate from a tube representing a source impedance of 7700 ohms, etc. In addition, transformers can be used for applications differing considerably from those shown, keeping in mind that impedance ratio is constant. Lower source impedance will improve response and level ratings . . . higher source impedance will reduce frequency range and level rating.

* 200 ohm termination can be used for 150 ohms or 250 ohms, 500 ohm termination can be used for 600 ohms.
** 200 ohm termination can be used for 150 ohms or 250 ohms, 125/500 ohm termination can be used for 150/600 ohms.
*** can be used with higher source impedances, with corresponding reduction in frequency range. With 200 ohm source, secondary impedance becomes 250,000 ohms . . . loaded response is –4 db. at 300 cycles.
**** can be used for 500 ohm load . . . 25,000 ohm primary impedance . . . 1.5 Ma. DC.
