# HELPFUL HINTS
## for using the IRE DIRECTORY

A few minutes' study of the basic layout of the IRE DIRECTORY will help you to find the information for which you are looking more quickly and more accurately. At first glance, the IRE DIRECTORY may seem to be confusing, but by using the various portions of the book as listed below, you will find your way around easily, and will discover that it is actually a very simple arrangement, and a much more logical one than a purely alphabetical terminology listing.

***PINK SECTION*** at the front of the products and firms section contains a terminology index listing every product, major and minor, for which a list of manufacturers is given. Page numbers refer you to the page on which the listings for that product begin. Following this alphabetical index is a copy of the questionnaire which is sent to the firms who have furnished us with product information. A quick look through this questionnaire will help greatly in understanding the product arrangement. At the top of the first page of the pink section is a small index referring you to the opening page of the complete-data spread section, the alphabetical directory, and each of the three product directories.

***THE COMPLETE DATA SPREAD SECTION*** (pages 1-134) contains product advertisements of great usefulness to the reader. Most of these advertisements are two pages or more, and all of them contain complete information on the products manufactured by the advertising firms—specifications, prices, illustrations, and suggested applications.

***ALPHABETICAL DIRECTORY OF MANUFACTURERS*** (pages 135-240) contains a list of 3,843 firms representing the majority of buying and selling power in the radio-electronic industry. Each firm listing contains the complete mailing address and telephone number for the firm. Following the state name in the firm address, a list of code numbers is given. These numbers refer to the 104 major products listed in the book (for quick reference to the meaning of the codes, use the questionnaire form in the pink section). Following the telephone number is the year in which the firm was founded, the total number of employees, the number of IRE members employed, and the net radio-electronic sales during the last fiscal year.

***THE THREE DIRECTORIES OF PRODUCTS ARE:***

1. Complete Equipment
2. Components
3. Materials and Services

This breakdown into three directories saves you from traveling through many products in which you are not interested at the moment, and helps you to turn immediately to the listings for the type of product you want, following a straight line to your destination. Use the Machol edge index at the top of the first page of the pink section to locate immediately the first page of the appropriate directory, then use the Machol edge index at the beginning of each directory to find the specific product you want. You don't even have to know the page number—the index will find it for you automatically!

***104 MAJOR PRODUCTS*** are listed within these three Directories. Each product listing contains a number of sub-headings so that you may know specifically what each firm makes. To interpret the code numbers shown after each firm's listing, consult the first page of that product class, where the sub-headings are defined. You will note that advertisements are positioned throughout the book in the most appropriate listing section, so that the advertisement for a relay manufacturer will appear in the relay section, to help you with further information on his product. Every advertiser's listing shows you the page number on which his advertisement may be found, and you will derive more value from this book if you consult these advertisements for facts you cannot find in the listings.

***COMPLETE ADDRESS LISTINGS*** are given only for advertisers in this section. If you wish to locate the address and telephone number for any other firm, it will be necessary to use the alphabetical directory.

***THE DISTRIBUTION SECTION*** is class 105, the last class in the book. This section contains a list of 2014 manufacturers representatives, distributors and jobbers, grouped geographically. See page 707 for a more complete explanation of the use of this section.

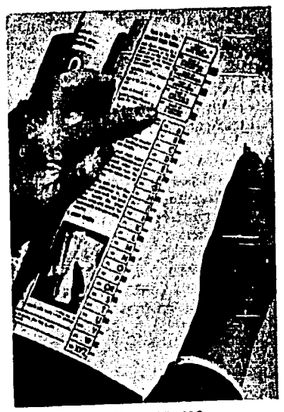
***ADVERTISER'S INDEX*** appears on pages 129-134 and on pages 766-768.

## How to Use the Machol Edge Index

| | |
|---|---|
| 1 | COMPLETE DATA SPREADS |
| 135 | ALPHABETICAL DIRECTORY |
| 241 | DIRECTORY I COMPLETE EQUIPMENT |
| 359 | DIRECTORY II COMPONENTS |
| 597 | DIRECTORY III MATERIALS & SERVICES |

High speed reference is a major objective of the IRE DIRECTORY. To this end we have adopted the Machol Edge Index system, and these indexes:

Advertisers Index, pages 129-134 and 766-768.



Key to Products, Pink Section.

Index to Spreads, 1.

Detailed Machol edge indexes will be found on the first page of the alphabetical Directory and each of the three major product Directories, pages 135, 241, 359, and 597. The Machol system will help you find both alphabetical and product sections swiftly.

### HOW TO USE

1. Bend the Directory almost double with the front cover page on the inside.
2. Hold in your right hand with your four fingers near to the bound edge and your right thumb near the middle of the open side of this page.
3. From the heavy or light line symbol adjacent to the subject you seek, run your eyes across the page edges until you reach the horizontally corresponding symbol.
4. OPEN THERE!

# 1961 IRE DIRECTORY

## Complete Data Spreads

The full spirit of the IRE DIRECTORY is to give the reader-engineer "facts" in complete detail, and specific enough to be of useful service. Our advertisers have recognized this, and many have made their copy presentation full of useful specifications and illustrations.

Actually, a Directory Publisher cannot hope to describe products adequately in standardized listings. Only the Advertiser, using display space, and with his own intimate knowledge of his service or product, can do the job right.

The advertisers listed below have done their utmost to provide the reader with engineering data in full detail, through spreads and catalogs filed in this book for easy access and permanent reference. This can prove to be the most useful part of the 1961 IRE DIRECTORY to you.

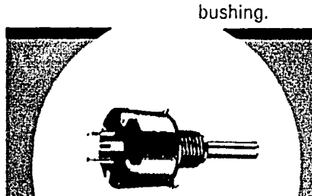
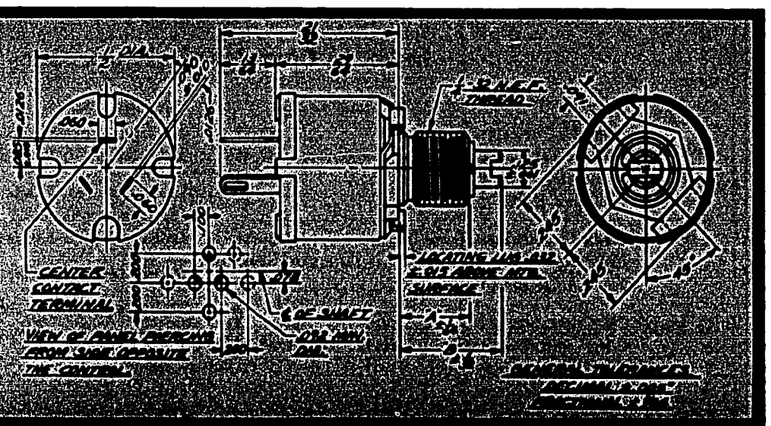
# NEW DOUBLE USE
# MIL-R-94B Style RV6 ½" Dia.
# ¾ Watt VARIABLE RESISTOR

CTS®



## UNIQUE CARBON-CERAMIC ELEMENT
## Helps 1 Control Do 2 Jobs:

**1** Surpass MIL-R-94B Style RV6 stability under military environmental conditions including moisture resistance and thermal cycling.



**2** Provide full ¾ watt power rating @ 70°C with derating to zero at 150°C on most values (25% to 50% better than MIL-R-94B Style RV6) for higher load and temperature applications. Result of efficient ceramic-to-metal heat sink.

**Other Features:**

- High insulation resistance.
- Internal hi temp O ring seal between shaft and bushing.
- For better continuity and reliability, resistance element has double contactor paddles with adequate spring range.

# hp offers complete coverage in quality oscilloscopes – DC to 500 MC!

## hp 185A DC to 500 MC

This revolutionary new sampling oscilloscope gives you fatigue-free viewing of *repetitive short pulses requiring a bandwidth up to 500 MC.* A rise time of less than 0.7 m$\mu$sec permits direct measurement and observation of fast phenomena. Bright, traces are provided even at repetition rates of 50 cps.

### Dual Trace Amplifier

Model 187A Dual Trace Amplifier (plug-in), permits observation and comparison of two high speed phenomena simultaneously, or highly accurate time measurements. Both channels have independent sensitivity and positioning controls; may be used separately. Vertical sensitivity is 10 mv/cm to 200 mv/cm; vernier increases sensitivity to 3 mv/cm. # hp 218AR Digital Delay Generator

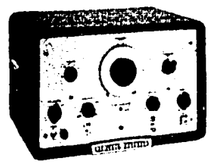
Independently adjustable time intervals or pulse delays
±0.1 μsec time interval accuracy
Crystal oscillator time base
Regulated power supplies

Model 218AR Digital Delay Generator is a totally new instrument applicable to many types of timing measurements including calibrating the range determining circuits of radar receivers, etc. The generator is built to rigid standards and is suitable for military use. It provides two precision time intervals or pulse delays, either of which are independently adjustable from 1 to 10,000 microseconds in 1 microsecond steps. These time intervals are accurate to within 0.1 microsecond ±0.001% of the selected value, and may be initiated from an internal multivibrator, 10 cps to 10 KC, or from an external rate generator, 0 cps to 10 KC. Total jitter does not exceed 0.02 microseconds in either case. The instrument also provides a 50-volt synchronizing output pulse at the beginning or end of a time interval, and a 1 microsecond timing comb output at the front panel.

### No count ambiguity



A unique feature of the new hp 218AR is its time base, a pulsed crystal controlled oscillator. The oscillator starts at $T_o$ and stops at the last output pulse. This eliminates the "plus-or-minus-1-count" ambiguity of many counter circuits in such application.

Model 218AR is a completely self-contained instrument, requiring only one or more hp 219 series plug-ins to perform a broad variety of time and delay generation measurements. Simplicity and flexibility are increased by the large variety of output signals provided by the plug-in units. The instrument is particularly compact and well-designed; etched circuits and the use of plug-ins materially increase circuit accessibility.

The instrument's power supplies are fully regulated to avoid effects of line voltage variations. It is available as hp 218AR, rack mount. $2,000.00.

# hp 560A/561B Digital Recorder, 570A/571B Digital Clock

- Continuous digital record from hp and Dymec counters, voltmeters, other equipment
- Direct reading, simple hookup
- Accuracy identical to driving instrument
- Records five 11-digit lines per second
- Secondary, coding data entered simultaneously

*hp 560A Digital Recorder* provides a permanent printed record of all types of test data. In addition, a unique analog output makes possible graphic recording of very small data variations.

The analog output is a voltage or current proportional to the number represented by any three consecutive digits of recorded data. This digitally-derived analog output provides zero-suppression which is virtually error-free. An inherent range-shifting feature keeps the record on scale. Expanded scale records with extreme resolution can thus be made using conventional potentiometer or galvanometer recorders.

Model 560A is normally furnished with 6 plug-in comparators for 6-digit presentation; additional comparators may be plugged in at any time.

*hp 561B Digital Recorder* requires 10-line coded decimal entry with separate connection for each position of each print wheel so that the instrument may be operated from the hp 405AR Digital Voltmeter, hp In-Line Frequency Counters or relays, stepping switches and beam switching tubes.

*hp 570A* (shown installed) *and 571B Digital Clocks* mount in the left-hand side of hp 560A and 561B respectively, and add time-of-day information to other recorded data. These clocks can also control rate at which measurements are made. In-Line, 6-place numeric readout; maximum 23 hours, 59 minutes, 59 seconds. Operates from internal or external time base.

**Prices:** hp 560A (with 6 comparators), $1,265.00△; hp 561B, $1,065.00△; hp 570A (fits 560A), $1,050.00; hp 571B (fits 561B), $950.00.

### DC OUTPUT

**Regulated for line and load**

| MODEL | VOLTAGE [1] | CURRENT [2] | PRICE |
|---|---|---|---|
| LA50-03A | 0-34 VDC | 0- 5A | $395 |
| LA50-03AM | 0-34 VDC | 0- 5A | 425 |
| LA100-03A | 0-34 VDC | 0-10A | 510 |
| LA100-03AM | 0-34 VDC | 0-10A | 540 |

[1] The output voltage for each model is completely covered in four steps by selector switches plus vernier control and is obtained by summation of voltage steps and continuously variable DC vernier as follows:

| MODEL | VOLTAGE STEPS |
|---|---|
| LA 50-03A, LA 50-03AM | 2, 4, 8, 16 and 0-4 volt vernier |
| LA100-03A, LA100-03AM | 2, 4, 8, 16 and 0-4 volt vernier |

[2] Current rating applies over entire output voltage range.

**Regulation:** *Line* Better than 0.15 per cent or 20 millivolts (whichever is greater). For input variations from 100-130 VAC.
*Load* Better than 0.15 per cent or 20 millivolts (whichever is greater). For load variations from 0 to full load.

**Transient Response:** *Line* Output voltage is constant within regulation specifications for step function line voltage change from 100-130 VAC or 130-100 VAC.
*Load* Output voltage is constant within regulation specifications for step-function load change from 0 to full load or full load to 0 within 50 microseconds after application.

**Ripple and noise:** Less than 1 millivolt rms with either terminal grounded.

### AC INPUT

## GENERAL SPECIFICATIONS

Sufficient tolerance is incorporated in the specifications to allow for normal commercial component and tube deviations. Tube replacements may be made with any equivalent tubes meeting E.I.A. specifications.

**INPUT** 105-125 VAC, 50-400 CPS, single phase. Exceptions: Models 50, 50R and 71—105-125 VAC, 50-60 CPS, Models LA50-03A and LA100-03A—100-130 VAC, 60 ± 0.3 cycle.

**DC OUTPUT** *Voltage Range:* Continuously variable over ranges specified, except where otherwise noted.

*Current Range:* The current ranges given apply to the entire DC output voltage range, and for input voltages from 105 to 125 VAC, and in the case of LA models 100-130 VAC, no "de-rating" is necessary.

*Polarity:* Either positive or negative terminal may be grounded.

**AC OUTPUT** The AC output is unregulated, isolated and ungrounded. It has a value of slightly higher than 6.3 V (when fully loaded) at an input of 115 VAC. This value allows for voltage drop in connecting leads. Dual outputs may be connected in series or parallel.

**DUTY CYCLE** Continuous duty at full load.

**METERS** Where meters are indicated, a separate voltmeter and milliammeter are provided.

**OVERLOAD PROTECTION** Ample protection is provided against external overload and internal failure conditions by means of fuses.

Circuit breakers of the magnetic, "trip-free" type are employed in Models 50, 50R, 71, LT and LA series, as protection against external overloads. And in the LT and LA series, the transistor complement is independently protected by special transistor circuitry.

**STYLE** Rack Models are designed for mounting on standard 19" relay racks.

Bench Models are provided with compact, specially-designed, ventilated cabinets equipped with carrying handles. The power supply units may be removed from their cabinets for mounting in standard relay racks (except Models 25, 26 and 71).

**RATINGS AND COMPONENTS** All components used are of the highest quality and are operated well within manufacturers' ratings. Hermetically sealed, oil-filled capacitors are used exclusively, except in LT series and LA series, where special high purity foil, long-life electrolytics are used. Hermetically sealed transformers designed to MIL-T-27A are used in the LA series, LT series and Com-Pak series. Ample safety factors are provided in the design to insure the long life, and the dependable, trouble-free operation so desirable in industrial and laboratory applications.

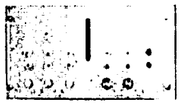
# CONTINUOUS TIME INTERVAL METERS AND DIGITAL DATA RECORDING SYSTEMS FOR TESTING INERTIAL GYROS, ACCELEROMETERS AND SIMILAR DEVICES

## MODEL 70-1 TIMER

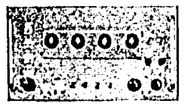


This timer has many applications other than that of testing inertial gyros, for which it was originally designed. Due to an electronic storage, it measures *continuous* time intervals. The count in storage is read out or printed out, while the interval is being measured.

When used in gyro testing, the timer measures elapsed time between pulses generated by the rate table. Both increments and continuous intervals are measured and the output is either time increment or incremental merus (milli earth rate units). This "timer with a memory" measures continuous time intervals to the nearest 0.001 seconds. When properly triggered, the decade counters transfer their count to storage, automatically re-set, and continue to count in less than 1 milli-second. The count held in storage is printed or punched on tape or card.

Internal crystal oscillators generate either a 10.00000 KC standard frequency or a 10.02738 KC sidereal. Six digits can be printed. Maximum time interval with standard time base is 999.999 seconds. Output is 1-2-2-4 code, 0-90 V level.

### MODEL 70-2 TIME AVERAGING UNIT



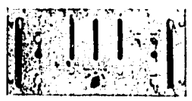
The time averaging unit averages out eccentricities present in test tables. It electronically averages output of two pick-ups such as photocells on the M.I.T. Type "D" tables.

The Model 70-2 has one input for each of the two pulse sources. It has two outputs: one presents a trigger pulse to the timer only after the second trigger pulse is received by the unit. The second output presents a variable frequency to the timer as a variable time base.

A self check feature checks the internal gating. Indicator lights show the proper sequence of operation.

### MODEL 70-3 TABLE ANGLE INDICATOR

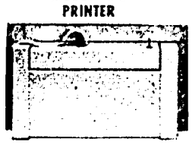
In measuring drift rate of inertial gyros, table angle corresponding to rate data must be known. This information is furnished by: Nixie readout, and printed or punched readout adjacent to the corresponding time or meru data.



The Model 70-3 may be used with 10 degree, 1 degree, 0.1 degree or 10 minute data. It may be used to trigger the 70-1 timer to give a times 10 degree average by stepping the 70-3 directly with the table pulse generator.

### MODEL 70-4 KEYBOARD CONTROL PANEL

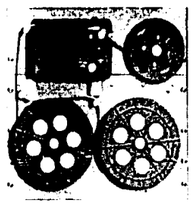
The control panel is used with the tape punch output and contains the metering, switching and indicators for the system. It also contains a manual keyboard for punching such information on the tape as gyro number, temperature, table number, revolution number, etc.



### MODEL 70-5 GYRO DECELERATION UNIT

The 70-5 records data for plotting curves of deceleration versus speed. Any number of runs may be recorded on one tape. Gyros with rundown times of 5 minutes or more can be plotted up to 60 points. Miniature gyros with rundown time of 30 seconds or less may be plotted up to 15 points.

Data may be processed in the computer and curves plotted by a point plotter; or may be reduced and plotted manually. Determination of friction, windage and pre-load are obtained.



### MODEL 70-6 PRINTER

This specially designed unit embodies a code converter with up to 4 input pulses and 1 output pulse to utilize the binary code output of the decade scalers. The matrix is solid state.

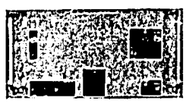
Direct reading may be in meru (milli earth rate units). The associated error is less than 0.1% between ±10 meru.

### MODEL 70-7 TAPE PUNCH

The tape punch readout punches two tapes simultaneously so that one tape can be processed at any time during the run, while the other tape will contain information for more than one run.

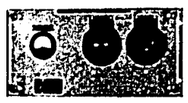
The tape punch data may be reduced in the computer to provide: fourier coefficients; gyro unbalance; residuals for each unbalance point; RMS gyro drift rate, etc.

### MODEL 80-1 TIMER



The 80 Series test equipment was designed to utilize the Farrand inductosyn, driven by the rotating test table.

The 80-1 timer measures *continuous* time intervals to ±1 μsec. Due to the time interval required for the particular printer readout used, the minimum time interval is 0.3 seconds so therefore, any greater interval is measured to an accuracy of ±1 μsec.



Timer can selectively be triggered by positive or negative pulses. It contains its own 100 KC time base or can be driven from an external standard. It has an attenuator on the input and a 1 sec and 10 sec self check. Output is binary coded decimal. Seven place readout is visible from front panel for reading self check as well as for viewing operation.

### MODEL 80-2 PRESET COUNTER

The inductosyn signal is fed to the preset counter. This special counter is designed to give pulses at zero cross-over of the inductosyn signal. These pulses are fed through a series of dividers and then through the output of the preset counter. Divisions are selectable from a front panel control. The 80-2 is calibrated for the following degrees per readout: 2, 10, 18, 20, 90, 360, 720. Front panel indicators visually show input pulses and output pulses.

### MODEL 80-3 TILT ANGLE INDICATOR UNIT

The tilt angle indicator Model 80-3 allows the setting of a precise angle of the test table with the inductosyn. Angles can be repeated to within 0.25 second of arc.

The unit contains excitation equipment for the inductosyns. Tilt angle readout, including a precision gear train, vernier reading dials, and a null indicator are integral.

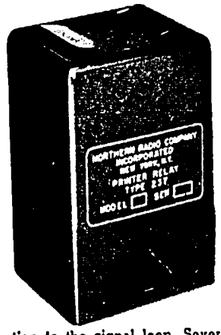
## LINE BATTERY P.S. PANEL

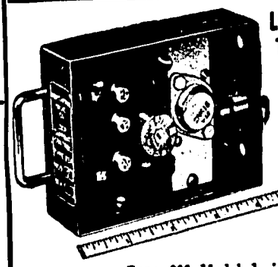
The Northern Radio Line Battery Power Supply Panel, Type 227 Model 1, is used as a source of DC power for teleprinter, telegraph and similar circuits. It is equipped with two (2) Type 228 Model 1 Power Supplies, to provide DC requirements for a group of eighteen (18) or less teleprinter channels. The two Power Supplies are normally mounted on the Line Battery Power Supply Panel, Type 227 Model 1, with one Supply operating and the second "standing-by." An automatic transfer circuit is provided on the panel to place the "stand-by" unit in operation should the first supply fail. The Line Battery Power Supply Panel, Type 227 Model 1, is 3½" high x 19" long. The AC input and DC output circuits are isolated from each other and also from chassis so that either side of the circuit may be grounded, or left ungrounded as may be determined.



**Technical Data:**
AC Input: 115/230 volt, 50/60 cycles AC ± 10%. Output Voltage: 120 volts DC nominal. Maximum Output Current: 1.2 amperes. Maximum Output Ripple Voltage: 2%.

## 16-CHANNEL DIVERSITY SYSTEM

- Diversity switching sensitivity from —60 dbm to 0 dbm



The Northern Radio Voice Frequency Telegraph Terminal, Type 235 Model 1, is a multi-channel frequency shift communications terminal used for transmission and reception of telegraph, teleprinter or telemetering signals over channels subject to fading or attenuation changes, such as long distance point-to-point radio circuits. It provides the necessary equipment for transmission of 16 intelligence channels over one (1) voice frequency circuit, and diversity reception of 16 similar channels, received through two (2) voice frequency circuits. The two (2) voice frequency receiving circuits are normally obtained from radio receivers arranged for space diversity reception. Means are provided to allow reception on a frequency diversity basis rather than space diversity. A combination of space and frequency diversity may be utilized for maximum reliability, when conditions are such as to require same. All the necessary equipment may be mounted in approximately ⅔ of one standard 7-foot telegraph rack.

## PRINTER RELAY
### Type 237, Model 1

The Northern Radio Printer Relay, Type 237 Model 1, is used as a coupling device between a DC teleprinter signal loop and the printer selector magnet. It replaces electro-mechanical signal relays and their associated local DC power supplies normally used with printers, providing the advantages of relays and improving printer performance but eliminating the maintenance problems which electro-mechanical relays introduce.

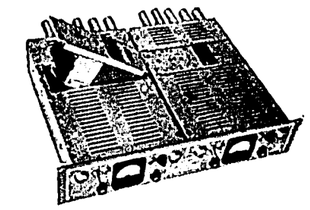
This device effectively isolates the reactance of the printer selector magnet, presenting a resistive termination to the signal loop. Several printers equipped with this device can, therefore, be connected in series with the same signal loop without harmful interaction between them. The Printer Relay may be used with either polar or neutral keyed signals. When neutral signals are supplied, the device automatically selects the proper operating level for the loop current supply, and can therefore tolerate large changes in absolute values of loop current without introducing appreciable distortion into the printer selector magnet. It normally mounts within the housing of the teleprinter.

## LOOP CURRENT CONTROL
### Type 238 Models 1 and 2

The Northern Radio Loop Current Control, Type 238 Model 1, is used as a current "normalizer" in DC teleprinter signal loops, to automatically maintain loop current at the optimum value despite changes in loop resistance or loop supply voltage.

The Loop Current Control, Type 238 Model 1, is designed for use in loops requiring a nominal 60 milliamperes operating current, while the Model 2 is designed for a nominal 20 milliampere circuit. Both models incorporate a calibration control to allow reasonable variations from these design values.

**Input Impedance:** Variable. Automatically changes as necessary to maintain "constant current" in the circuit to which connected. Maximum and minimum limit of operation are specified by allowable voltage drops across the terminals of the device.



**Voltage Limits:** Maximum—80 volts; Minimum—5 volts.

**Operating Currents:** Model 1: 60 milliamperes (adjustable 55-75 milliamperes). Model 2: 20 milliamperes (adjustable 10-30 milliamperes).

# MULTI-CHANNEL FREQUENCY SHIFT TONE TELEGRAPH SYSTEMS

These Multi-Channel Telegraph Systems are audio carrier systems capable of multiplexing such circuits as telephone lines, VHF, UHF, or radio frequency links—or practically any type circuit from which a two-wire audio circuit can be derived. Designed to meet any speed requirements, these systems are fully electronic, without relays or moving parts to wear. They can be used for high-speed printer, Morse or time division Multiplex circuits, as well as such application as Telemetering, Control Circuits and Servo-Mechanisms. Instantaneous and complete sending and channel control permits any binary code groups, either "Clear Text" or "Cryptographic," to be channelized without need for additional phasing or synchronizing equipment, while paralleling of channels will allow for transmission of other type codes, such as 3 element cable code. The completely independent operation of each channel, including its own power supply, localizes faults to one channel only, leaving other channels unaffected. Individual channel separation filters are used at both transmitting and receiving ends. This arrangement allows for sending telegraph or control signals over a circuit carrying, simultaneously, other forms of intelligence: or for two-way communications on the same line. The audio frequency shift principle of transmission provides for high fidelity of signal reproduction over a wide range of signal levels as well as under severe noise or interference conditions. Circuit requirements of any speed, shift and center frequency can readily be met. The systems illustrated are for use on printer circuits up to 100 WPM channel capacity. The system arrangement is very flexible, permitting grouping of the basic units into various arrangements of Multiplex Systems. These systems can be made to accommodate a large variety of channel numbers and speeds to meet any individual requirements. The flexibility is further improved by the fact that the racks, power control units, and terminal connection panels are the same for both transmitting and receiving terminals.

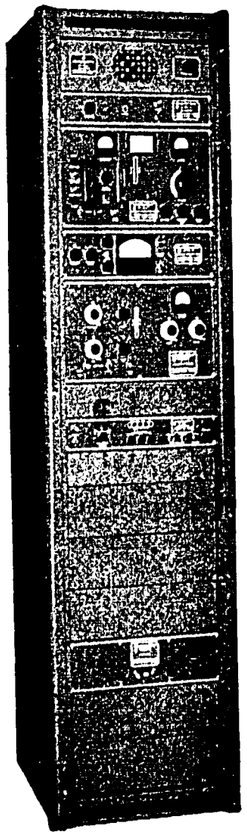
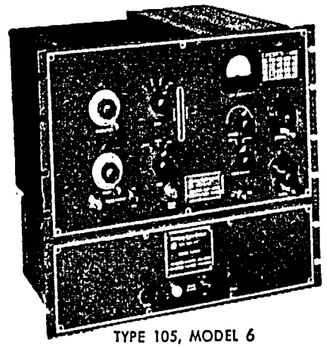
# Northern Radio FREQUENCY SHIFT TERMINAL EQUIPMENT

## FREQUENCY and SHIFT MONITOR SYSTEM



This system consists of a Type 106 Frequency and Shift Monitor and a Type 127 Frequency Meter. It is designed as a secondary standard to monitor the frequency and amount of shift of transmitter carrier output. It is particularly intended to measure the frequency shift of a mark and space (FS) signal either when setting up for traffic or under normal keying conditions.

The Monitor's stability is better than 2 cycles per megacycle over an ambient temperature range of 0-50° C—using crystals having a temperature coefficient of only 3 parts/million/degrees C. Range is 2.5-30 mc with 10 crystal-controlled frequencies (separate panel trimmers for each); use of external oscillator also provided for. Frequency Shift range is 10-10,000 cps. Less than 100 millivolts RF input needed for 2 volts audio output.



The Frequency Meter is specially designed with selectable normal and fast-acting damping factors, permitting frequency measurements of signals while keying. Its accuracy is 2% of full scale for the ranges 0-200, 500, 2000, 5000, 20,000 cps.

METER: TYPE 127, MODEL 2
MONITOR: TYPE 106, MODEL 4

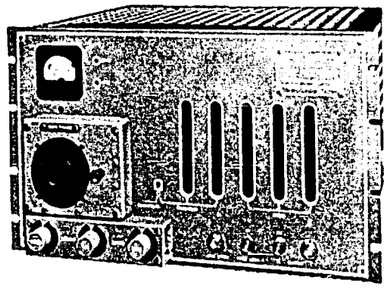
## TWINPLEX COMBINER TYPE 177 MODEL 1

For twinplex operation, the transmitting terminal includes a Twinplex Combiner Type 177 Model 1.

The Twinplex communication system makes possible a 2-channel radio circuit whereby 2 non-synchronous or synchronous telegraph transmissions modulate a single radio carrier wave causing the carrier to assume one of four specific frequencies with 400 cps separations.

The Combiner converts the four possible conditions of two telegraph signals (M1-M2, M1-S2, S1-M2, S1-S2) respectively into one of four voltages related in a 0-1-2-3 manner. The Combiner output voltage modulates the Frequency Shift Keyer.



The two telegraph channels provide the same operational flexibility as that of two separate single channel FS systems. One can, for example, simultaneously use channel #1 on 60 wpm teletype and channel #2 on high-speed Morse or Time-Division Multiplex.

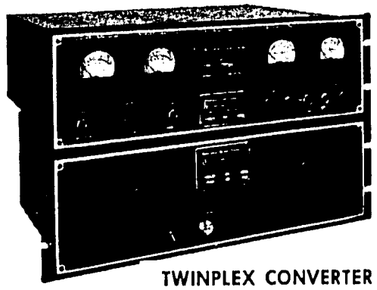
## VARIABLE MASTER OSCILLATOR TYPE 173 MODEL 1

The Northern Radio Company Variable Master Oscillator provides a continuously variable source of radio frequency energy with a stability of approximately 1 cycle per megacycle in the range of 2 to 4 megacycles. It may be used as the basic control oscillator for diversity receivers, high frequency transmitters and other communications devices, or as a laboratory standard for test and measurement functions.

Its ease of operation and direct reading of frequency make it an outstandingly useful device where precise frequency control must be maintained by completely unskilled personnel. No curves, interpolations or calculations of any kind are required in its use. Frequency is set approximately to the desired value by rotating the oscillator dial. The last three digits of the frequency automatically pulls in to the valve pre-set on the switches and holds with an accuracy that exceeds that of most temperature-controlled crystal oscillators.

**HIGH FREQUENCY OSCILLATOR**



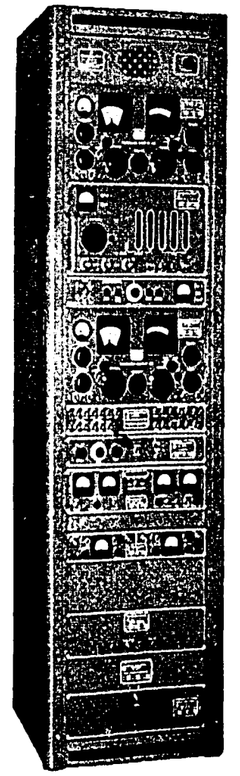
Output Frequency: 2-4 MC continuously variable.
Stability for any combination of temperature range from 0 to 50° C, and line voltage of 115 to 230 ± 10%: Approximately 1 cycle per megacycle.
Output level: ½ watt into 75 ohm load. Lever control on rear of chassis.
Readability: ± 2.5 cycles per second. Direct digital readout on mechanical and electronic counters.
Resettability: Absolute.

**BEAT FREQUENCY OSCILLATOR**

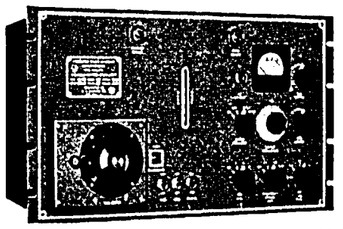
Output Frequency: 400-800 KC crystal controlled.
Output Level: 3.5 volts into 1000 ohm load. Level control on rear of chassis.

**TIME BASE CRYSTAL OSCILLATOR**

Output frequency 100 KC
Stability for 0 to 50° C and ± 10% Line Voltage change: 0.2 part per million for any 12 hour period; 1.0 part per million for thirty days.
Output Level: Approximately 2 volts.
Output Impedance: Approximately 100,000 ohms.



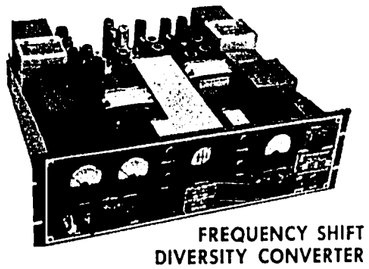
## TWINPLEX CONVERTER TYPE 178 MODEL 1



This Twinplex communication system makes possible a 2-channel radio circuit whereby 2 non-synchronous or synchronous telegraph transmissions modulate a single radio carrier wave by causing the carrier to assume one of four specific frequencies with 400 cps separations.

The receiving equipment consists of the Twinplex Converter Type 178 Model 1 and a single or diversity receiver such as the Northern Radio Type 110 Dual Diversity Receiving System. The Converter demodulates and separates the four audio tones from the radio receiver(s) into two channels each carrying the originally transmitted intelligence. The Twinplex Converter replaces the standard FS Converter for this purpose.

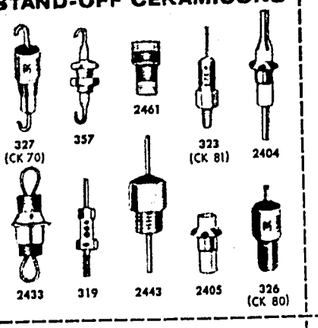
The two telegraph channels provide the same operational flexibility as that of two separate single channel FS systems. One can, for example, simultaneously use channel #1 on 60 wpm teletype and channel #2 on high-speed Morse or Time-Division Multiplex. It further permits the reception of channel #1 signals on all standard FS converters (tunable to 400 cps shift) without need for a Twinplex Converter: this is valuable for "Forked Circuit Operation" where the intelligence of channel #1 is intended for pick-up by other receiving stations which are not equipped for Twinplex Reception in addition to the main receiving stations which are so equipped. Reception of channel #2 (or of both channels) requires the receiving end to be equipped with a Twinplex Converter.



TYPICAL RECEIVER TERMINAL for TWINPLEX OPERATION

## VARIABLE MASTER OSCILLATOR TYPE 115, MODEL 1

The Variable Master Oscillator Type 173 (above) may be replaced by this Variable Master Oscillator Type 115 Model 1 which is designed principally for use in diversity reception to supply variable or crystal HFO voltage to the receivers. Its variable frequency has a stability equivalent to that obtained by non-temperature-controlled crystal oscillators. It also provides 3 HFO crystals for operation of diversity receivers where fixed frequencies are required, and 2 BFO crystals.



## FREQUENCY SHIFT DIVERSITY CONVERTER TYPE 174, MODEL 1

For use with either single-receiver frequency diversity systems or 2-receiver space diversity systems. By means of plug-in units, any reasonable number of channels is available between the frequencies of 425 and 3315 cps for either frequency or space diversity operation. For standard FS operation, the plug-in networks provide shift adjustments from 100 to 1000 cps shift.
Normal Input Level: −40 to +10 VU (Zero VU = 1MW into 600 ohms). (Satisfactory operation on fades to −60 VU.)
Limiter Recovery Time: Negligible for a 40 VU differential between Mark and Space frequencies.
Output: 65 ma into 2000 ohms floating (self-contained line battery).
Keying Speed: Maximum of 40 dot cycles with narrow band frequencies diversity. Up to 400 dot cycles with the wide band networks.
Monitor: 2-inch Cathode Ray tube
1 input phone jack
2 input volume level indicators
1 output current indicator

**ask Amperex about AMPLIFRAME tubes**

*AMPLIFRAME, a new concept in electron tubes, designed and mass produced exclusively by Amperex, incorporates the unique FRAME GRID...the closest approach to the ideal "Physicists' grid"—electrical characteristics but no physical dimensions. The FRAME GRID results in: • higher transconductance per milliampere • tighter $G_m$ and plate current tolerance • low transit time • low capacitances • lower microphonics • rugged construction

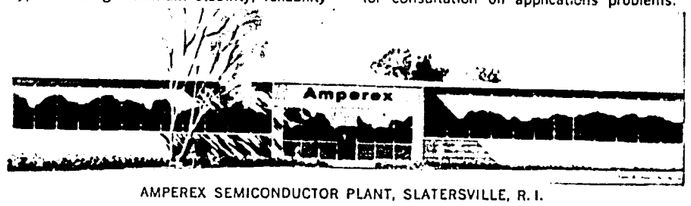
**Amperex P.A.D.T. Post Alloy Diffused VHF Transistors for converter, mixer and oscillator applications**

**Amperex P-N-P and N-P-N transistors for audio, computer and switching applications.**

**Amperex germanium and silicon diodes, including silicon reference and power rectifier types**



Implemented and fully proven by Amperex, a unique manufacturing technique originating with Philips of the Netherlands now enables Amperex to provide you with production VHF Post Alloy Diffused Transistors of unparalleled laboratory quality at truly reasonable prices.

The new Amperex "Post-Alloy-Diffused" P-N-P Transistors combine the best qualities of both the alloy and the diffusion approaches to transistor construction. As a result of the special "self-jigging" techniques, a maximum degree of uniformity is achieved, thus eliminating the need for "selection."

Correspondingly, special Amperex precision tooling methods and fully automated high volume manufacturing equipment, are the user's guarantee of a complete line of semiconductor diode and UHF transistor types offering maximum stability, reliability and uniformity at minimum cost.

The accelerated development of new Amperex transistor and diode types and the unlimited availability of those presently listed, is further assured by the inauguration of a new Amperex semiconductor plant in Slatersville, Rhode Island.

The facilities of the Amperex applications laboratory and the Amperex R & D laboratory are always available to customers for consultation on applications problems.

## SOCKET FOR NUVISTOR TUBE

Low insertion force and contact protection . . . require minimum space . . . fulfilling every requirement for miniaturized equipment.
No. 133 65 10 001

The socket provides two slots of different widths mating with two corresponding legs depending from the metal envelope of the tube to index the tube and socket contacts. As a result the tube can be inserted by feel only and it is impossible to insert the tube incorrectly or damage the contacts. The socket saddle provides spring elements that engage with the depending legs of the tube envelope thus grounding the envelope to the panel.

## ALL MOLDED OCTAL SOCKET

This new all molded Octal socket offers a complete one piece construction. The saddle and body are a single casting.

The standard socket is molded of general purpose Bakelite. Contacts are of brass, cadmium plated. Mica insulation with brass or phosphor bronze contacts can be made available. Two contact layouts can be supplied.

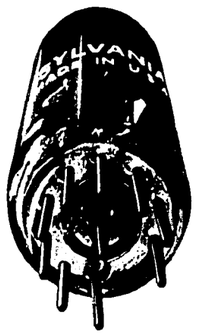
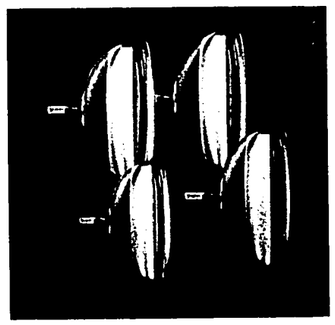
## for reliable entertainment designs

Give your designs the benefits of Sylvania tube reliability . . . reliability that is best enhanced by these notable tube developments.



**SARONG CATHODE**—a thin film of cathode material made to precise measurements for uniformity and wrapped on an ultrasonically-cleaned cathode sleeve. Sarong Cathode significantly minimizes plate-to-cathode and heater-to-cathode arcing, eliminates cathode "hot spots," improves life expectancy, provides high uniformity of electrical characteristics from tube to tube.



**9-T9 TUBE OUTLINE**—straight-sided bantam envelope with 9-pin miniature pin circle, 9-T9 increases volumetric efficiency of the chassis by eliminating the octal base of the T9 outline. Too, 9-T9 makes possible use of large tube assemblies capable of high plate dissipation in printed circuit applications normally using T-6½ sockets.

**100mA TUBES**—Sylvania 100mA-heater tubes feature low ambient temperatures, allow compact chassis design, reduce the requirement for heat shielding, enable use of inexpensive plastics. Heater design provides for more balanced distribution of the heater voltages in the heater string. Surge voltages across individual tubes are minimized—increasing tube heater life expectancy.

**10-PIN TUBES**—provide new multi-unit combinations in one bulb, enable compact designs, offer important circuit economies and improved performance. Addition of tenth pin to the center of the standard 9-pin miniature circle provides a means of tying elements to individual pins for improved isolation and for the inclusion of a separately connected interstructure shield. 10-pin design can offer tubes with inherently low input capacitance.

**"BONDED SHIELD" PICTURE TUBES**—squared-corner picture tube with integral safety-cap. Available with specially treated cap that can diffuse up to 70% of reflected light without appreciable loss in resolution—eliminating the old problem of mirror images. Bonded Shield eliminates front-of-the-cabinet safety glass, reduces front-to-back cabinet dimensions, offers potential savings in set manufacture.

**LOW POWER HEATER-CATHODE ASSEMBLY**—requires only 140mA at 1.5V, less than 7% of the power normally needed. Low mass of the assembly plus low heater-power requirements make it especially suitable for design into picture tubes for portable, battery-operated TV receivers.
