HELPFUL HINTS

for using the IRE DIRECTORY

A few minutes' study of the basic layout of the IRE DIRECTORY will help you to find the information for which you are looking more quickly and more accurately. At first glance, the IRE DIRECTORY may seem to be confusing, but by using the various portions of the book as listed below, you will find your way around easily, and will discover that it is actually a very simple arrangement, and a much more logical one than a purely alphabetical terminology listing.

PINK SECTION at the front of the products and firms section contains a three-page terminology index listing every product, major and minor, for which a list of manufacturers is given. Page numbers refer you to the page on which the listings for that product begin. Following this alphabetical index is a copy of the questionnaire which is sent to the firms who have furnished us with product information. A quick look through this questionnaire will help greatly in understanding the product arrangement. At the top of the first page of the pink section is a small index referring you to the opening page of the complete-data spread section, the alphabetical directory, and each of the four product directories.

THE COMPLETE DATA SPREAD SECTION (pages 1-150) contains product advertisements of great usefulness to the reader. Most of these advertisements are two pages or more, and all of them contain complete information on the products manufactured by the advertising firms—specifications, prices, illustrations, and suggested applications.

ALPHABETICAL DIRECTORY OF MANUFACTURERS (pages 151-253) contains a list of 3,265 firms representing the majority of buying and selling power in the radio-electronic industry. Each firm listing contains the complete mailing address and telephone number for the firm. Following the state name in the firm address, a list of code numbers is given. These numbers refer to the 100 major products listed in the book (for quick reference to the meaning of the codes, use the questionnaire form on pages v-viii of the pink section).

THE FOUR DIRECTORIES OF PRODUCTS ARE:

1. Communications Equipment
2. Components
3. Controls and Instruments
4. Materials and Services

This breakdown into four directories saves you from traveling through many products in which you are not interested at the moment, and helps you to turn immediately to the listings for the type of product you want, following a straight line to your destination. Use the Machol edge index at the top of the first page of the pink section to locate immediately the first page of the appropriate directory, then use the Machol edge index at the beginning of each directory to find the specific product you want. You don't even have to know the page number—the index will find it for you automatically!

100 MAJOR PRODUCTS are listed within these four Directories. Each product listing contains a number of sub-headings so that you may know specifically what each firm makes. To interpret the code numbers shown after each firm's listing, consult the first page of that product class, where the sub-headings are defined. You will note that advertisements are positioned throughout the book in the most appropriate listing section, so that the advertisement for a relay manufacturer will appear in the relay section, to help you with further information on his product. Every advertiser's listing shows you the page number on which his advertisement may be found, and you will derive more value from this book if you consult these advertisements for facts you cannot find in the listings.

COMPLETE ADDRESS LISTINGS are given only for advertisers in this section. If you wish to locate the address and telephone number for any other firm, it will be necessary to use the alphabetical directory.

THE DISTRIBUTION SECTION is class 100, the last class in the book. This section contains a list of 1,425 manufacturers representatives, distributors and jobbers, grouped geographically. See page 605 for a more complete explanation of the use of this section.

ADVERTISER'S INDEX appears on pages 148-150, and on pages 635 and 636.

How to Use the Machol Edge Index

High speed reference is a major objective of the IRE Directory. To this end we have adopted the Machol Edge Index system, and these indexes:

Advertisers Index, pages 635-636.

Key to Products, Pink Section.

Index to Spreads, 1.

1	COMPLETE DATA SPREADS
151	ALPHABETICAL COMPANY LIST
255	DIRECTORY I COMMUNICATIONS
287	DIRECTORY II COMPONENTS
459	DIRECTORY III CONTROLS & INSTRUMENTS
521	DIRECTORY IV MATERIALS & SERVICES

Detailed Machol edge indexes will be found on the first page of the alphabetical Directory and each of the four major product Directories, pages 151, 255, 287, 459, and 521. The Machol system will help you find both alphabetical and product sections swiftly.

HOW TO USE

1. Bend the Directory almost double with the front cover page on the inside.
2. Hold in your right hand with your four fingers near to the bound edge and your right thumb near the middle of the open side of this page.
3. From the heavy or light line symbol adjacent to the subject you seek, run your eyes across the page edges until you reach the horizontally corresponding symbol.
4. OPEN THERE!

IRE DIRECTORY
Complete Data Spreads

The full spirit of the IRE DIRECTORY is to give the reader-engineer "facts" in complete detail, and specific enough to be of useful service. Our advertisers have recognized this, and many have made their copy presentation full of useful specifications and illustrations.

Actually, a Directory Publisher cannot hope to describe products adequately in standardized listings. Only the Advertiser, using display space, and with his own intimate knowledge of his service or product, can do that job right.

The advertisers listed below have done their utmost to provide the reader with engineering data in full detail, through spreads and catalogs filed in this book for easy access and permanent reference. This can prove to be the most useful part of the 1958 IRE DIRECTORY to you.

-hp- 540A Transfer Oscillator

Measure frequency to 12 KMC on pulsed, AM, FM, CW and noisy signals!

With just two instruments *-hp-* 540A Transfer Oscillator and 524B Counter (plus 525B converter) you measure to 12 KMC; get counter accuracy and amazing convenience. Complex instrument arrangements and tedious trial-and-error "guesstimates" are eliminated. Even when the approximate frequency of a test signal is unknown; a simple calculation employing two or more harmonics leads to swift and accurate measurement.

The 540A-524B system's accuracy approaches 1 part per 1,000,000 for stable CW signals. On pulsed signals, accuracy is governed by carrier frequency and pulse lengths. On noisy or intense AM signals, the transfer oscillator system with *-hp-* 540A often provides the only means of accurate measurement. Over-all system accuracy is better than 10 times that of the best microwave wavemeters. Model 540A, $615.00△.

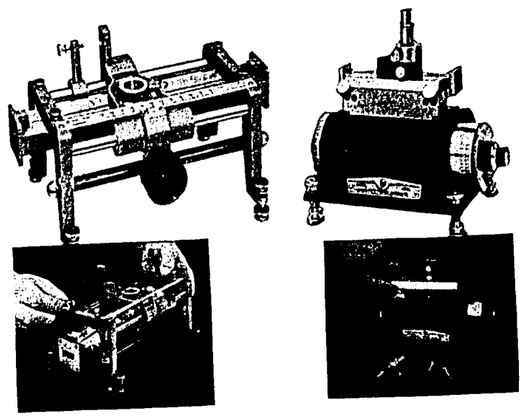
-hp- Offers World's Most Complete Array of Microwave Equipment

-hp- 809B/814A Universal Probe Carriages



Models 809B and 814A are precision built mechanical assemblies operating, respectively, with -*hp*- 810B and 815A series slotted sections.

Combination of the 809B carriage and 810B slotted sections covers 2.6 to 18.0 KMC. Combination of 814A carriage and 815A series sections covers 12.4 to 40.0 KMC.

On either carriage, waveguides can be interchanged in seconds for real savings on engineering time. Only one probe is required for each carriage to cover full frequency range. Manufacture is of highest quality to assure positive mechanical positioning of interchangeable waveguides and precise installation of mating -*hp*- probes (see opposite page). -*hp*- 809B has a vernier scale reading to 0.1 mm and is equipped for dial gauge mounting. -*hp*- 814A has a cylindrical dial which may be read directly to 0.1 mm and interpolated at 0.01 mm.

-hp- 810B Slotted Sections. -*hp*- 810B, for mounting in 809B carriage, is a flanged, waveguide section with accurately machined slot. Slot is tapered at ends to minimize reflection. Available in 5 waveguide bands, 3.95 through 18.0 KMC.

-hp- S810A. Complete slotted section assembly including probe carriage. In 2.6 to 3.95 KMC (s-band) size only.

-hp- 815A Slotted Sections. For mounting in 814A carriage. Available P, K and R bands, 12.4 to 40.0 KMC. To insure positive positioning when mounting in carriage, these sections seat on two eccentric rods. Rods are factory-adjusted so longitudinal plane of guide is always parallel to probe travel.

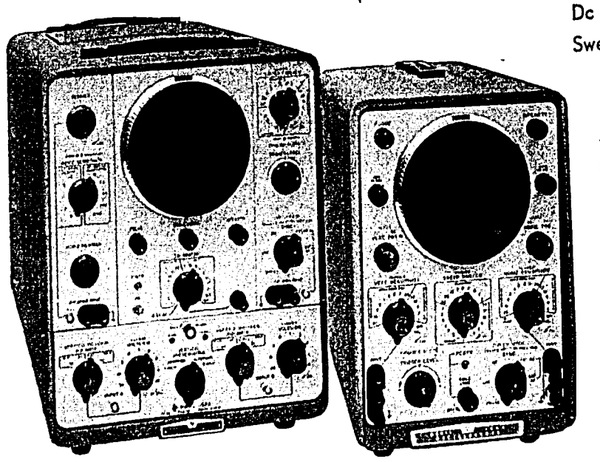
-hp- Low Frequency, High Frequency Oscilloscopes

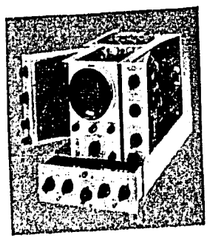
-hp- 150A High Frequency Oscilloscope

Dc to 10 MC. Plug-in pre-amplifiers.
Sweeps 0.02 μsec/cm to 15 sec/cm



-hp- 130A Low Frequency Oscilloscope

High sensitivity, dc to 300 KC.
Sweeps 1 μsec/cm to 12.5 sec/cm



Never before in -*hp*- history have two instruments gained such immediate and wide-spread usage as the all-new -*hp*- oscilloscopes.

Based on a completely fresh philosophy of oscilloscope design, new -*hp*- 130A and 150A establish new standards of oscilloscope usefulness, convenience, dependability. Important feature is universal automatic triggering arrangement where one preset adjustment provides optimum triggering for most conditions. Other appreciated features include direct-reading calibrated sweeps, brilliant, high resolution trace without halo or bloom, etched circuits with unitized construction, concentric, color-coded controls, highest quality components and ultra conservative design, twistoff bezel, easy CRT or filter interchange, tilt bail.

-*hp*- 150A, dc to 10 MC, has plug-in vertical amplifiers offering either high gain or dual trace. The instrument sweeps 0.02 μsec/cm to 15 sec/cm; there are 24 direct reading calibrated sweep ranges. May be triggered internally, by line voltage, or externally. Horizontal amplifier's magnification feature expands horizontal sweep 5, 10, 50 or 100 times. Vertical amplifier has rise time of less than 0.035 μsec; signal delay permits leading edge of triggering signal to be viewed. For maximum flexibility; 18 calibrating voltages in 2, 5, 10 sequence, 0.2 mv to 100 v peak-to-peak, are available at the front panel.

-*hp*- 130A, dc to 300 KC, has similar vertical and horizontal amplifiers with sensitivity 1 mv/cm to 50 v/cm. Instrument sweeps 1 μsec /cm to 12.5 sec/cm, may be triggered internally by line voltage, or by a 0.5 volt or larger external source. 21 sweep times may be directly set; no interpolation required. Includes input attenuator with calibrated ranges in 1, 2, 5, 10 sequence; continuous adjustment vernier between ranges. Attenuator, plus instrument's high stability, permits use of 130A as millivoltmeter or voltmeter accurate to within 5%.

-*hp*- Model 130AR is similar to the 130A but is designed specifically for rack mounting. This instrument has a x5 magnifier for all internal sweeps increasing the fastest sweep time to 0.2 μsec/cm.

Instrument	Primary Uses	Characteristics	Price
-*hp*- 130A	General laboratory and production testing	Dc to 300 KC—High sensitivity	$ 650.00
-*hp*- 150A	General laboratory high frequency and TV work	Dc to 10 MC—Plug-in vertical amplifiers	1100.00
-*hp*- 151A	High sensitivity—Plug-in for 150A	Dc to 10 MC—High sensitivity	200.00
-*hp*- 152A	Dual Trace—Plug-in for 150A	Dc to 10 MC—Presents two phenomena for simultaneous viewing	250.00

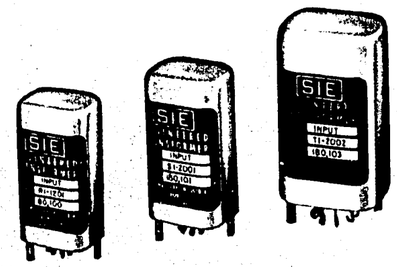
SIE is the world's largest manufacturer of electronic seismograph instruments, having supplied more than 420 complete systems to organizations operating throughout the world. The complete SIE line of geophysical equipment includes geophones, galvanometers, recording oscillographs, magnetic tape recorders, matched sets of amplifiers, control and checking units, blasters, power supplies, and special vehicle bodies.

Shown above is an SIE G-22A high production seismograph system. The RO-22A-10 Oscillograph records fifty channels on ten-inch paper, and all of the components in the GA-22A amplifiers are hermetically sealed for low noise and long life.



SIE Precision Engineered Transformers and Reactors are manufactured by the Hermetic Seal Transformer Division of Southwestern Industrial Electronics Company. Standard designs for low frequency applications are small, hermetically-sealed units and offer uniform response characteristics from 5 to 1000 cps. Special precautions are taken to insure identical phase characteristics . . . a feature that is very important in the manufacture of matched sets of amplifiers.

The Hermetic Seal Transformer Division also produces a wide variety of standard and custom-designed transformers and chokes. Some of these special components are: low-level, low-frequency, high-inductance coils, hum-bucking construction types; wound components with single, double, or triple Mu-metal shielding; and high-temperature insulation and toroidal windings on a wide variety of core materials.

SIE transformers include a complete line of products built to the requirements of specification MIL-T-27A. Other wound components from SIE include recording heads and magnetic amplifiers.

NEW OCTAL SOCKET

—LETS YOU STANDARDIZE PRINTED CIRCUIT TECHNIQUES

• Sylvania introduces a new octal socket designed for printed circuits. It incorporates the basic design features of the widely used 7- and 9-pin sockets, making it possible for you to develop new, more compact printed circuitry which can be standardized in production.

Current production can be speeded, too, by incorporating the new Sylvania printed-circuit octal socket wherever standard or compromise mountings are now being used.

Sylvania printed circuit sockets offer these important features

- All molded insulator
- Superior contact characteristics
- Top surface insulation
- Nesting for automatic feeding
- Positive orientation
- Cross-contact wiring

NEW SPECIAL SOCKETS

Neo-diheptal socket assembly for color TV picture tubes. Molded in low loss phenolic or alkyd. Compact design, only 11/16" deep. Leads can be supplied taped, stripped, twisted and solder dipped.

Counter Tube Socket with "zero-adjust" feature. Provides ±10° adjustment of socket orientation, providing for positive zero adjustment upon original installation as well as replacement.

NEW OHMITE TAN-O-MITE® TANTALUM CAPACITORS

The new Tan-O-Mite® line of wire-type subminiature capacitors features six sizes which collectively offer sufficient range and flexibility to satisfy the design needs of any manufacturer of miniaturized equipment. Sizes "S" and "T" *constitute the smallest units of this type available.* (Note dimensions in table below.) Tan-O-Mite® foil-type and wire-type tantalum capacitors both feature greater capacitance per unit volume, lower leakage current and power factor, and small capacitance drop at extremely low temperatures as compared to other types of electrolytics. Ohmite engineers will work with you on your design requirements.

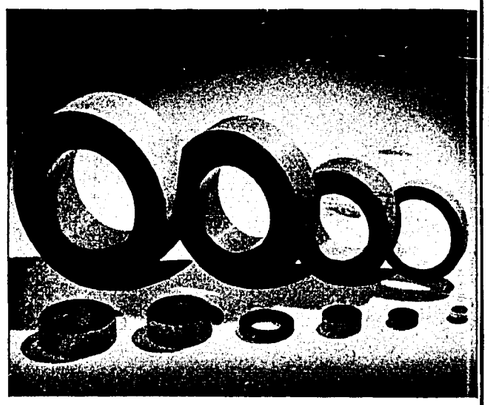
HERE'S HOW TO SPECIFY

Performance-Guaranteed TAPE WOUND CORES

Magnetics, Inc. manufactures "Performance-Guaranteed" Tape Wound Cores using such commercially available alloy materials as Hy Mu 80, 48 Alloy and Orthonol. These alloys, when properly processed, fill the majority of applications in which tape wound cores are used today.

Each "Performance-Guaranteed" Tape Wound Core is coded by a part number which describes it in great detail. Knowing this code will greatly simplify your purchasing and assembly line practices.

1. 50,000 series are Standard Cores in Phenolic Boxes
   51,000 series are Standard Cores in Aluminum Boxes
2. Number preceding final letter is tape thickness in mils
3. Final letter describes the high permeability material as follows: A—Orthonol D—Hy Mu 80 H-48 Alloy



Example: A typical core number is 51029-2A
1. 51,000 indicates a standard core in an Aluminum Core Box.
2. The number preceding final letter is 2, indicating tape thickness is 2 mils.
3. Final letter is A, showing Orthonol is the material.

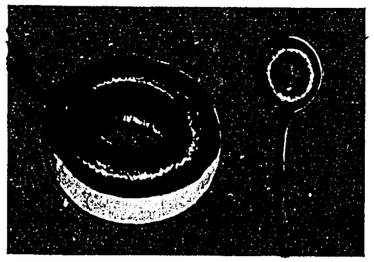
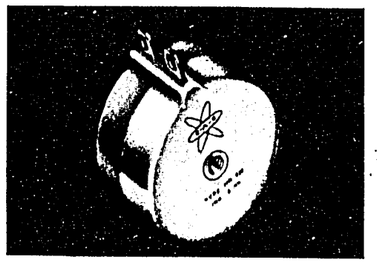
TOROIDAL INDUCTORS



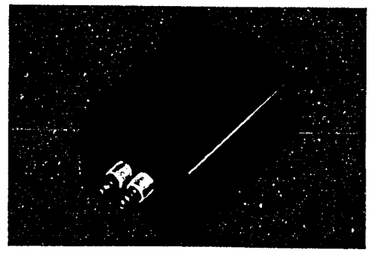
UNCASED TOROIDS

Basic inductor component. Plain, wax or plastic dipped with flex-leads. Hi Q values 10cps to 10mc. Complete range of sizes: subminiature, wedding ring and up to 12" OD. Standard inductances stocked for immediate delivery. Mass production utilizing CAC-designed winding equipment enables swift completion of large orders.



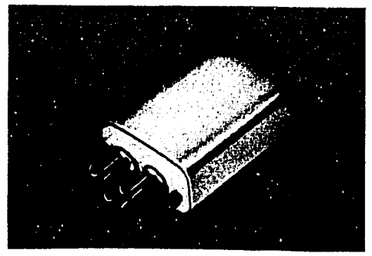
PLASTIC CASED TOROIDS

CAC compression molded toroids per Mil specs have become the standard of the industry. Most compact design — may be stacked — mounted by center bushing which absorbs mounting pressures — sturdy, tinned terminals — arrangements available up to 6 terminal connections. Standard inductance values shipped from stock — special inductances and configurations supplied promptly on request.



HERMETICALLY SEALED CASED TOROIDS

CAC "HS" series provides metal encased, hermetically sealed units complying with MIL specifications. Mounting area minimized — extremely low hum pickup — terminals of proven design using Teflon assure permanent seal at temperature extremes. Rugged construction — convenient mounting facilities. To insure stability, cores are thermo-cycled prior to encasement. Standard inductances in stock.



SUBMINIATURE TOROIDS

Uncased, plastic molded and hermetically sealed in three standard core types (others available). Designs for all requirements—for chassis mount or printed circuits.

For the engineer whose design considerations dictate the utmost in electrical performance versus size, CAC's subminiature toroids present the answer.

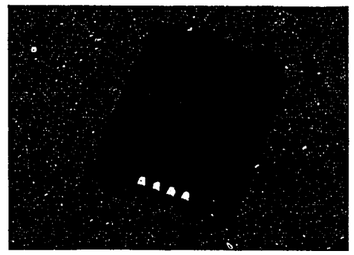
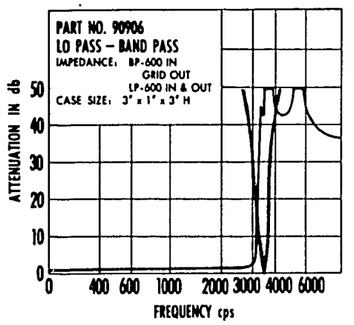
L-C AND MECHANICAL FILTERS



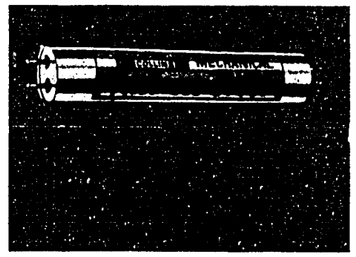


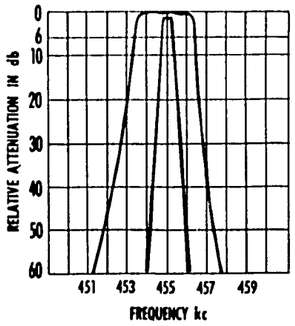
L-C FILTERS

L-C filters utilizing high Q toroidal inductors and high quality capacitors are the heart of these frequency selective components. Recent developments of magnetic materials and highly stable capacitors have extended the useful frequency and temperature range of electrical wave filters. Use of impedance transformations, near unity coupling, and other applications of advanced network theory result in high performance units in small volume packages.

Low pass, high pass, band pass and band stop filters can be designed covering sub audio to over 500kc range. Line, interstage or other impedances can be specified. Filters can be designed for direct paralleling where required. High permeability cases and the closed toroidal form assure low hum pickup. Temperature stabilization on the order of 0.1% frequency can be attained through use of negative TC compensation to offset slightly positive coil and capacitor characteristics.

Depicted response curve is for an integrally packaged low pass—band pass filter employing the latest design and production procedures. This unit uses less chassis area and is an excellent example of subminiature coil usage, impedance transformations, and printed circuitry. Hermetically sealed to meet the military specifications.





MECHANICAL FILTERS *(Developed and mfd. by Collins Radio Co.)*

The new Collins manufactured, miniaturized "Y" series mechanical filters provide obvious circuitry design advantages. The response characteristics of the "Y" series are identical to the previous styles of Collins mechanical filters which of course are available from stock in series "A", "Z", "F", "H", "J", and "K".

The new "Y" series advantages are as follows:

1. Smaller size!
2. Standard performance!
3. Lowest priced mechanical filters yet!
4. Ideal for transistorized printed circuit applications!
5. From Stock! Center frequencies of 455kc and 6db bandwidths of 2.1kc (F455Y-21), 3.1kc (F455Y-31), 4.0kc (F455Y-40), 6.0kc (F455Y-60), 8.0kc (F455Y-80), 12.0kc (F455Y-120), 16.0kc (F455Y-160), and 35.0kc (F455Y-350). Other bandwidths available soon.

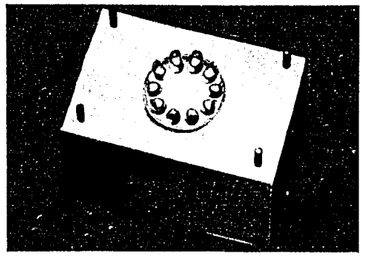
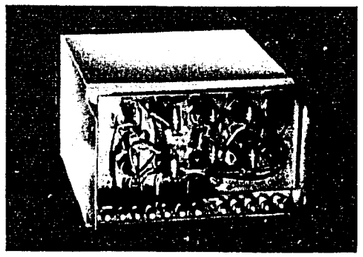
MAGNETIC AMPLIFIERS AND TRANSFORMERS



MAGNETIC AMPLIFIERS

Custom computer amplifiers with high stability and linearity can be designed having single or multiple inputs to your specific needs. Servo drives and relay actuators are also available. Frequency selective networks can be integrally designed to provide additional useful control functions. Proven packaging techniques insure minimum size—proven toroidal construction assures highest performance.

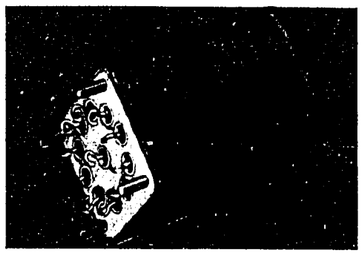
Typical Temperatures..... −60°C. to +150°C.
Typical Line Frequencies..... 60cps to 6000cps



MISSILE POWER TRANSFORMERS

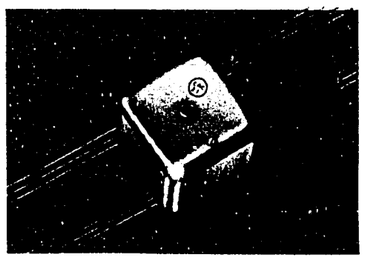
Recommended for supply frequencies above 400 cps and where size performance and reliability are factors. Thin nickel alloy toroidal cores reduce core losses. Toroid structure cures stray field problems.

SEALED MISSILE POWER SUPPLIES combining toroidal power transformers, toroidal filter chokes, hi temp capacitors and silicon rectifiers. These units offer multiple outputs and low ripple. Low stray field of toroidal elements obviate usual internal shielding. Mag regulation where required.



LAMINATED TRANSFORMERS AND INDUCTORS

A complete line of laminated constructed units are now available through CAC. Our highly qualified engineering staff, a well complimented laboratory, humidity controlled production facility with modern manufacturing equipment guarantees conformance with any specifications. Both power and audio transformers employing advanced techniques can be supplied either hermetically sealed or encapsulated to 150° C. ambients. Catalogues, supplied upon request, cover a wide range of standardized designs including omnirange and ILS Filters.



PRECISION RATIO COMPUTER TRANSFORMERS

Toroidal form of construction is ideal for designing precision ratio transformers since the turns of wire are applied to and adjusted *on* the core. Normal production procedure of zero turn accuracy, high permeability cores, low phase shift, and near unity coupling will yield laboratory quality on any production run. Advanced design and newest packaging methods provide optimum performance with minimum size and rugged construction.

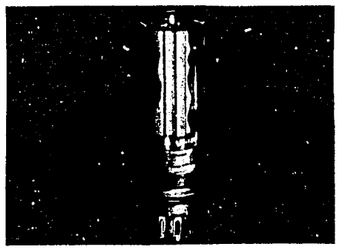
TEMPERATURE CHARACTERISTICS OF TYPE LTC-7

FERRITE CORES *(Mfd. by Collins Radio Co.)*

Requirements for extreme temperature stability and consistently reproducible cores encouraged the Collins Radio Company to enter the magnetic materials field. Now, after several years of intensive research and development, these cores are available through CAC in many standard or custom forms for all applications. Temperature characteristics developed exhibit 10 times improvement over previous materials. Special saturation and other properties are presently available. Technical bulletins upon request.



HEAT DISSIPATING TUBE SHIELDS *(Mfd. by Collins Radio Co.)*

Heat treated beryllium copper corrugated liner and socket insert are highly resilient and accommodate wide variations of tube diameter. Base liner reduces bulb temperature in most critical tube area. Interchangeable with standard JAN equipment. Tube cannot work out of socket through long term vibration. Maximum electrostatic shielding.

New RCA Super-Power Tubes deliver unprecedented levels of electronically controlled power to work new industrial miracles

To add a new dimension to the usefulness of electronically controlled power—in industry, medicine, research . . . RCA now presents a major "first" in electronic progress—a remarkable group of super-power tube designs capable of unleashing enormous amounts of high-frequency power *above and beyond all previous tube capabilities!*

Ingenious in their application . . . dramatic in their results . . . these tubes begin their work where conventional power tubes leave off. Think for a moment of the possibilities of a million watts, or more, of electronically controlled power *harnessed to your industry*—working with hairline accuracy under millionth-second control. Consider the enormous potential of this electronic tool for heating glass, metals, plastics, and other materials at super speeds . . . irradiating and sterilizing products . . . "blasting" atoms for applied uses of atomic particle acceleration.

Visualized by the Radio Corporation of America as early as 1937 . . . and under a continuing development and field-testing program . . . RCA super-power tubes are now offered to progressive industries looking ahead to the practical application of super power in their future product planning. RCA is ready to discuss your present and future needs for super-power tubes. If *you* are ready, write today—to RCA, Tube Division, Commercial Engineering, Section 122Q-a, Harrison, New Jersey.

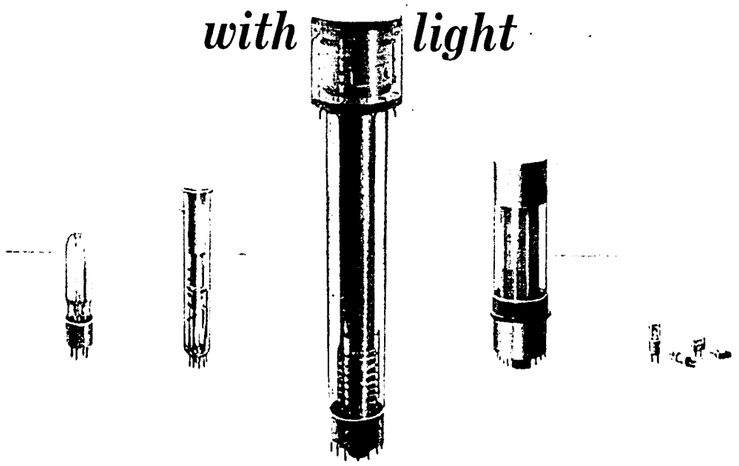
Through the magic of photoelectronics —RCA Tubes work wonders with light



Like a modern genie of Aladdin's tales, RCA photosensitive devices are putting light to work in amazing ways to control, inspect, measure, guard—efficiently, speedily, and economically.

In industrial television, for example, RCA TV camera tubes are helping to improve product quality, increase production, train personnel, protect life and property—extending human vision into places heretofore impractical or too hazardous for man to work.

In work with invisible radiation, RCA Multiplier Phototubes are used in devices to: Simplify geophysical surveys... determine thickness of materials...conduct atomic particle research (an RCA Tube helped in the discovery of the antiproton)...study material flow, growth of organisms, wear of machinery, and effectiveness of chemicals through radioactive tracer techniques.

In control work using light, RCA Phototubes and Photosensitive Cells are serving as "electronic switches" to help industry: Turn street lights and display signs on and off..."read" film soundtracks and computer punch cards...measure light, and compare colors...inspect, sort, and route materials.

And this is just an inkling of the myriad applications in which RCA photosensitive devices are used in industry, medicine, and science. If you see where photoelectronics holds a special promise in your operations, we will be glad to put you in touch with organizations specializing in photoelectronic equipment Simply write RCA Commercial Engineering, Section 122Q-b, Harrison, N. J.

Amazing new RCA Storage Tubes "memorize and process" electronic data ...make millionth of a second stand still!

To extend the usefulness of electronic data processing...in industry...business...research...medicine, RCA announces new spectacular tools for technological progress–a remarkable group of "storage" tubes that can "remember" electronic data...slow it down...translate it...or display it.

Take the RCA-6866 tube for example. Used today in airborne radar, this unique device transposes electronic information into brilliant pictures *you can see in bright daylight.* It can display data in line or half-tone form. It captures fixed or slow-moving subjects with equal clarity—*"freezes" millionth-second pulses for study as long as a minute.* Visualize what your electronics engineers can accomplish with a tube like this in the design of equipment—to transmit written information electronically from point to point—to reproduce signatures, charts, ticket data, reservations, sales orders via regular telephone-type lines—to help analyze transient phenomena taking place at super speeds.

And there are other RCA storage tubes to excite the imagination of engineers. One such tube, the Radechon, can take electronic data occurring at phenomenal speeds...store it...then extract any part of it at the same or different speeds. Another tube, the Graphechon, translates electronic information for reproduction on TV screens wherever wanted. Already, Radechons and Graphechons are working miracles in data processing.

Today, RCA is engaged in an extensive storage-tube development program that holds promise of revolutionizing industry by electronics. If you see a place for application of these new tubes in your future business, write RCA Commercial Engineering, Section 122Q-c, Harrison, N.J.

Operating Reliability

...extended to new levels of performance

To pace the demands for higher quality tubes in critical applications, RCA "Premium" Tubes and Computer Tubes have opened new possibilities for sustained reliability that exceeds previous levels of tube performance. Here are two important ways in which RCA insures that it *builds* QUALITY into these tubes:

1 RCA has developed a precision-type quality-control system that provides never-ending vigilance over the quality of "Premium" Tubes and Computer Tubes—*throughout every phase of tube manufacture.*

2 RCA backs up this quality-control system with 100% microscopic monitoring of 24 different categories of tube workmanship. By this method, each manufacturing point is constantly under surveillance, and prompt corrective action can be taken if needed.

Precision Quality-Control—coupled closely with microscopic monitoring—is another big step ahead in the manufacture of RCA "Premium" Tubes and Computer Tubes to assure excellent uniformity of characteristics and long-term reliability.

Your RCA Field Representative will welcome an opportunity to discuss the unusual advantages of RCA "Premium" Tubes and Computer Tubes for your specific applications. Contact him at the RCA Field Office nearest you:

First of all, for reliability!

At Hughes, reliability is the standard upon which every device is based, from research and development through all phases of production. Its significance to you can only be determined if you specify Hughes, if you actually design our units into your equipment. Then you will *know* that Hughes reliability means trouble-free operation under even the most severe operating conditions.

GERMANIUM POINT-CONTACT DIODES

STANDARD—A large series comprising RETMA, JAN and special types, all having Hughes' famous glass package for complete protection from contaminant penetration. For applications in computers, radar, communications equipment, control equipment.

Peak Inverse Voltage	50-190V	Min. Forward Current @ +1V	3-200mA
Max. Inverse Working Voltage	40-150V	Max. Inverse Current @ −50V	.050-.850mA

QUICK RECOVERY, HIGH CONDUCTANCE—Germanium diodes with all the features of the standard series plus quick recovery and high conductance together.

Peak Inverse Voltage	50-130V	Min. Forward Current @ +1V	20-150mA
Max. Inverse Working Voltage	40-100V	Max. Inverse Current @ −50V	.050-.500mA

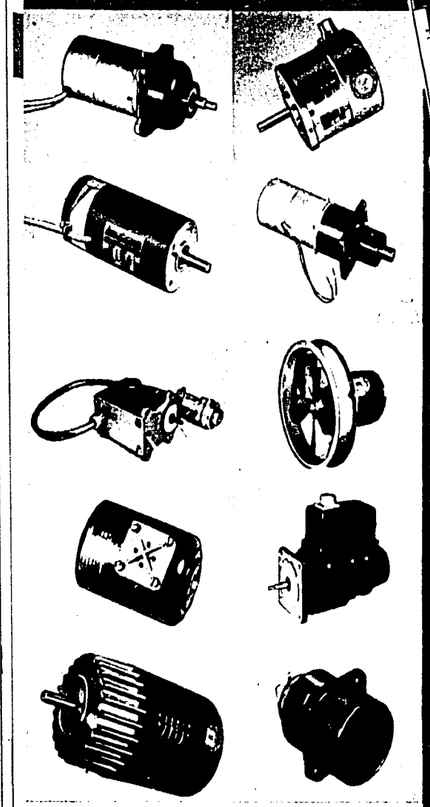
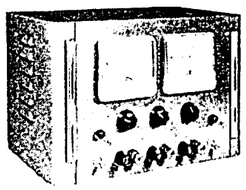
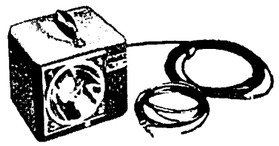
WESTERN GEAR



Pictured above are only a few of Western Gear's complete miniature motor line, ranging from 1/500th to 4 HP. Choose from cycle ranges of 50 to 400 at any voltage required. Furthermore, if our basic designs do not meet your particular requirements, our engineers will be glad to work with you on your rotary electrical problems WITHOUT OBLIGATION!

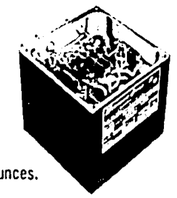


LABORATORY-TYPE POWER SUPPLY— New from Western Gear, Electro Products Division, is this lab-type, voltage-regulated power supply, available in either cabinet or rack type mounting. Input voltage is 105 to 125 volts at 50 to 60 cycles per second. Three output voltages are available . . . continuously variable 0 to 300V DC at 150 MA; continuously variable 0 to negative 150V DC at 5 MA; and 6.3V AC at 8 amperes. For full information, use the coupon below.

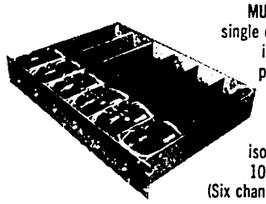


STROBOSCOPE UNIT— Now available, a reasonably-priced, compact, true-color stroboscope for viewing rotary, reciprocating or repetitive motion, as designed and manufactured by Western Gear's Electro Products Division. SPECIFICATIONS: Flash duration, 10 microseconds; light output, 5 Lumen seconds per flash; repetition rate, 0 to 100 pulses per second; dimensions, 6" wide, 5" high, 5¾" deep. For complete information, mail the coupon below.

TRANSISTORIZED VOLTAGE REGULATOR— Rugged conditions are made to order for this precision unit, especially where performance, space and weight are of extreme importance. The circuitry employs a shunt power transistor and a temperature-compensated Zener diode reference voltage. Input voltage is 31V DC plus or minus 4V. Output of the 7VR12 is 5V DC at 100 to 200 MA. Regulation less than plus or minus .1 per cent for combined variations of input voltage, load current, temperature, drift and vibration. Dimensions 2 x 2 x 2. Weight 8.5 ounces. For more of the story, check and mail the coupon below.



CLIP AND SAVE



MULTIPLE CHANNEL STRAIN GAGE POWER SUPPLY— Model 7P01 single or multiple channel strain gage power supply, 115 V, 60 cycle input, 10V DC output, adjustable from 9-11V DC with a 10-turn potentiometer. Output voltage changes less than plus or minus .05% due to temperature change from 0 to 45°C; output voltage changes less than .1% due to 2% change in load current. Output ripple is less than 300 microvolts RMS, isolated from ground as follows: insulation resistance to ground, 10,000 megohms; AC pickup voltage to ground, 5 microvolts peak. (Six channel unit shown.) For complete information, mail coupon below.

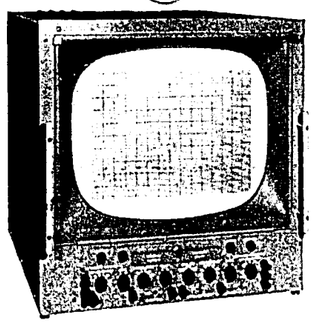
MEASURING AND TESTING EQUIPMENT



LARGE SCREEN OSCILLOSCOPES

Available in 21" Bench Console and 17" Rack Mounted Model. Basic models of each type are available; the "35" Dual Response Medium Sensitivity Models, and the High Sensitivity "40" Model featuring Differential Input in the 1 to 10 Millivolt Sensitivity Range. These Oscilloscopes feature unequalled stability and linearity.

MULTI-CHANNEL OSCILLOSCOPES

Large Screen Multi-channel Oscilloscopes feature forty input channels and permit continuous reading of forty separate signals.

The display consists of a vertical bar graph 9" high by 12" wide. The vertical length of each line indicates the value of the maximum input voltage which existed during the previous tenth of a second.

SWEPT FREQUENCY GENERATORS

Used in conjunction with an oscilloscope provides an amplitude versus frequency display of high accuracy. The frequency response plots obtained thereby permit highly accurate and rapid production testing and calibration of frequency sensitive devices. This instrument also enables the user to determine instantly the effects of changes in circuit parameters upon frequency characteristics, thus permitting an optimum design to be obtained in minimum time.

DESIGN ACHIEVEMENTS WITH SUPRAMICA* ceramoplastics

SUPRAMICA ceramoplastics . . . . . .

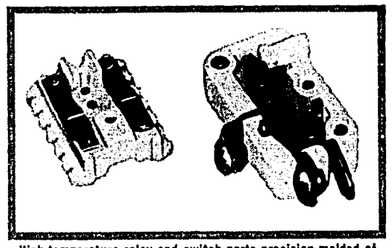
MOLDED OR MACHINABLE HIGH TEMPERATURE INSULATION

Supramica ceramoplastics, the world's most nearly perfect high temperature insulations, are formulated with SYNTHAMICA* synthetic mica. Supramica possesses high temperature and thermal shock resistance, and complete dimensional stability. Thermal expansion coefficients are the same as steel. They have low electrical loss, excellent arc resistance, high dielectric strength, and are impervious to moisture, oil and organic solvents, with permanent resistance to radiation.

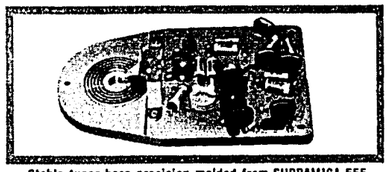
SUPRAMICA* 560 — New insulation for **continuous operation** at 500° C (932° F). Lightweight material can be precision molded with fragile inserts . . . specified for conditions **which no other material can meet!** Specific gravity similar to that of aluminum or mineral-filled polyesters . . . perfect for relay bases, connectors, radomes, tube sockets and other components for high temperature use.

SUPRAMICA* 555 — Precision-molded ceramoplastic having high-temperature endurance up to 750° F. Moldable with or without inserts.

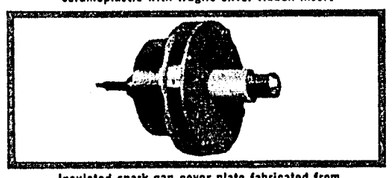
SUPRAMICA* 500 — Compression-molded ceramoplastic sheets and rods for use at temperatures up to 900° F. Readily machinable; not precision moldable. Inserts must be cemented.



High-temperature relay and switch parts precision molded of SUPRAMICA 560 ceramoplastic



Stable tuner base precision molded from SUPRAMICA 555 ceramoplastic with fragile silver ribbon insert



Insulated spark gap cover plate fabricated from SUPRAMICA 500 ceramoplastic

MYCALEX* glass-bonded mica . . .

MOLDED OR MACHINABLE ELECTRICAL INSULATION

Mycalex glass-bonded mica formulations have been recognized for many years as high-temperature, high-frequency insulation . . . impervious to oil and water, resistant to high temperatures, with total, permanent dimensional stability and thermal expansion coefficient equivalent to that of insert metals . . . resistant to radiation.

MYCALEX 410* Glass-bonded mica precision-molded with or without inserts, for applications involving temperatures up to 650° F.

MYCALEX 400* Standard compression molded glass-bonded mica for operating temperatures to 850° F. Readily machinable, but not moldable. Inserts must be cemented.

MYCALEX* 385 Glass-bonded mica with excellent resistance to circuit breaker arcing and thermal shock, for continuous operating temperatures up to 700° F. Readily machinable, but not moldable in intricate shapes.

MYCALEX TM telemetering switches

WITH SUPRAMICA CERAMOPLASTIC COMMUTATOR PLATES ASSURE RELIABLE OPERATION UNDER EXTREME CONDITIONS

Precision-molded Supramica ceramoplastic commutator plates have introduced a degree of accuracy and sustained dependability never before approached in telemetry. Where warpage of only .0002" of the commutator plate will distort and destroy the value of the signal, these precision switches withstand extremes of temperature, altitude, shock and vibration and deliver a clean, unvarying signal . . . tests show completely satisfactory performance of these switches after more than 1000 hours at 1200 RPM.

In military and industrial applications, Mycalex TM Telemetering Switches with Supramica ceramoplastic commutator plates have made significant contributions to the reliability of electronic equipment.

MYCALEX ELECTRONICS CORPORATION

SYNTHAMICA* synthetic mica . . . .

Available in commercial quantities, as powder, flake or crystal, and in chemically bonded sheets for all applications in the electronic, communications and related industries. Manufactured from readily available native raw materials, Synthamica synthetic mica is an important contribution to the development of military and civilian electronics.

Synthamica synthetic mica is chemically pure, hydroxyl free, and will withstand temperatures almost twice as high as its natural counterpart. One of the outstanding properties of this crystal clear material is the freedom from outgassing at elevated temperatures and pressures.

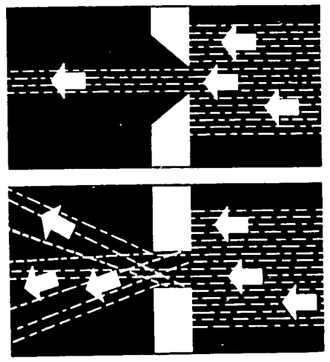
New tapered hole aperture mask—an actual photograph at 18X magnification.

NEW, TAPERED HOLE APERTURE MASKS[1]

. . . for sharper, truer color TV

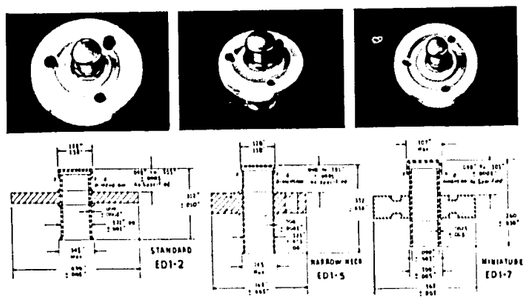
Here's a way to reduce beam diffusion, minimize false color and get better color TV pictures—in your present-design picture tubes.

Ideally, an aperture mask should have zero thickness. Electrons impinge on the walls of cylindrical holes, and are deflected out of the narrow beam. Instead of striking a single dot, they sometimes strike adjacent color dots. The result is a hazy picture or false color. But with these new Superior Tube tapered-hole aperture masks, beam diffusion is practically eliminated. The walls of the tapered holes lie outside the path of beam electrons—even at the extreme edges of the picture. The electrons see only the holes.



See how electron beam passes through hole without diffusion. There are nearly 500,000 of these holes in each mask—all controlled to close tolerance.

Notice how old cylindrical hole aperture mask can diffuse electron beam. Electrons striking aperture walls are scattered over several dots.



Standard disc cathodes. *(EDI-2) Most widely used cathodes in TV, radar test equipment, computer storage tubes and special beam type tubes.*

Narrow neck disc cathodes. *For 110 cathode ray tubes (EDI-5). Make possible shorter, narrower neck tubes and wider beam deflection angle. In growing use for portable TV.*

Miniature disc cathodes. *(EDI-6 and EDI-7) Save up to 50% heater power. Ideal for tri-gun color TV tubes. Make possible use of smaller deflection yokes and smaller cabinets.*

DISC CATHODES

. . . three types, to cover all applications

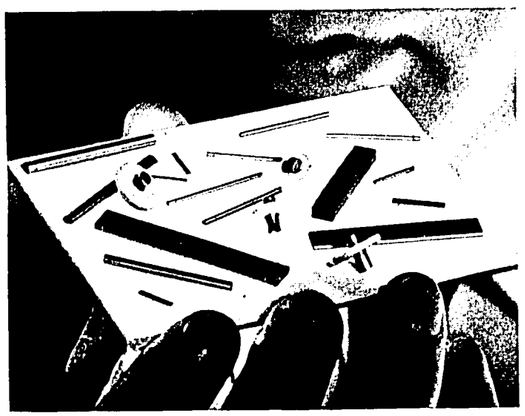
In all Superior Tube disc cathodes, the critical "E" dimension (distance from top of ceramic to top of emission cap) is guaranteed accurate within ±.0005". Hence makers of TV picture tubes and other cathode ray tubes can save the time and cost of compensating for "E" dimension variations on the assembly line. Because of this close dimensional control, cathodes can be used universally in different tubes and are interchangeable with each other during electron gun assembly. Both manufacturing efficiency and quality control can be significantly improved.

In addition, Superior Tube precision disc cathodes offer these four important advantages:

1. *Separate cap alloy.* Permits the choice and use of best alloys for both cap and shank in varying applications.
2. *Slight flare of shank opening.* Easier insertion of heater. Less abrasion of heater coating during normal expansion and contraction.
3. *Shadow groove in ceramic.* Inhibits electrical leakage between cathode and No. 1 grid.
4. *Chemically clean shank interior.* Minimizes heater-cathode leakage.

THE CATHALOYS[2]

. . . cathode alloys free from sublimation and interface impedance



The Cathaloys are not only the world's most versatile cathode alloys, but they offer advantages not available in any other: high strength, high activity, or a combination of both plus low sublimation and freedom from interface impedance. In addition, they give electron tube manufacturers the assurance that they can produce tubes with new uniformity in performance characteristics. Even before being approved for production, each heat of a Cathaloy metal must be tested in an electron tube.

Of the five Cathaloys developed so far, A-32, the all-around active alloy and P-50, the all-around passive alloy, fill the vast majority of applications requirements. The others offer special advantages in countless applications. Principal characteristics are as follows:

Cathaloy A-32.[3] Suitable for active alloy applications. Can be used for ruggedized tubes. Contains tungsten. Approximately 50% stronger than tungsten-free alloys.

Cathaloy P-50. Suitable for applications requiring a passive alloy. Available in Weldrawn[2] tubing. The only alloy commercially available in Weldrawn as well as in Lockseam.[4]

Cathaloy A-31. Specially designed for extreme stress applications. Contains 4% tungsten. Approximately twice as strong at high temperatures as tungsten-free alloys.

Cathaloy A-30. An active alloy. Versatile, yet not as strong as A-32. A good material for entertainment-type tubes.

Cathaloy P-51. 100% stronger than Cathaloy P-50. Ideal for ruggedized tubes. Available in seamless, Weldrawn and Lockseam forms.

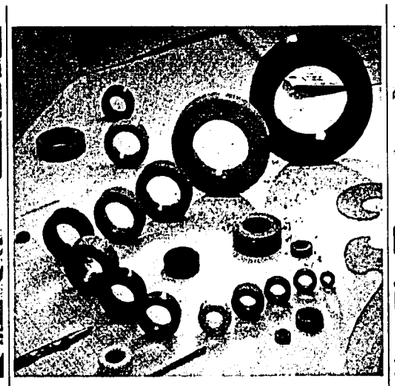
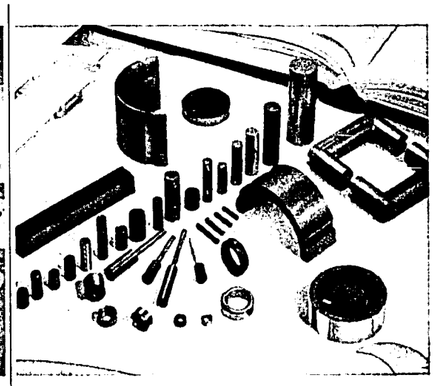
C and E cut cores, tape wound cores, and bobbin cores..



Mo-Permalloy powder cores.



Iron powder cores.

Write for Bulletin SC-107

TYPES "C" AND "E" CUT CORES

Available in more than 500 standard sizes and almost any special size, Arnold "C" and "E" Cores are made from precision-rolled Silectron strip (highly oriented silicon steel) in 1, 2, 4 or 12-mil thicknesses and a wide variety of window sizes and core areas, for high and low-frequency applications. Sizes range from a fraction of an ounce to hundreds of pounds.

Insulated strip of the proper width is wound on a mandrel, then heat treated, bonded and cut into halves. Careful control results in accurately dimensioned and matched core halves whose effective air gap at the butt joint is very small. Rigid standard tests are employed for both "C" and "E" types of cores, and special tests where required.

Write for Bulletin TC-101A

TAPE WOUND CORES

Depending upon the specific properties required, Arnold Tape Wound Cores are available made of Deltamax, 4-79 Mo-Permalloy, Supermalloy, Mumetal, 4750 Electrical Metal, or Silectron . . . in standard tape thicknesses of 1, 2, 4 or 12-mils, and in ultra-thin gauges of ½ and ¼-mil where required.

This gapless type of core construction results in maximum effective working permeability with minimum flux leakage. Practically any size core can be supplied, from a fraction of a gram to hundreds of pounds. Toroidal cores are made in 30 standard sizes with protective nylon or aluminum cases. Special sizes of toroidal cores, and all square or rectangular tape wound cores, are produced to individual requirements.

Write for Bulletin TC-108

BOBBIN CORES

These cores, fabricated by winding ultra-thin tape of high-permeability magnetic materials on ceramic bobbin cores, possess ideal qualities for use in electronic computer assemblies. Their desirable properties include quite rectangular hysteresis loops, relatively low coercive values and high saturation densities; plus temperature stability and the ability to shift in a few microseconds from negative remanence to positive saturation, and vice versa, under conditions of pulse excitation.

Arnold Bobbin Cores are available in a wide range of sizes, tape thicknesses, widths and number of wraps to suit the ultimate use of the core. Magnetic materials usually employed are Deltamax, Square Permalloy and Supermalloy, in standard thicknesses of 1, ½, ¼ and ⅛ mil. Special advantages derive from Arnold's position as a fully-integrated producer of wound cores, able to maintain precise control over every production operation . . . melting, rolling, winding, testing, etc.

MO-PERMALLOY POWDER CORES

These toroids provide high Q in a small volume, characterized by low eddy current and hysteresis losses.

Arnold Mo-Permalloy powder cores are supplied in four standard permeabilities: 125, 60, 26 and 14 Mu. They provide constant permeability over a wide range of flux density. The 125 Mu cores are recommended for use up to 15 kc; the 60 Mu at 10 to 50 kc; the 26 Mu at 30 to 75 kc; and the 14 Mu at 50 to 200 kc. Many of these cores may be furnished stabilized to provide constant permeability (±0.1%) over a specific temperature range.

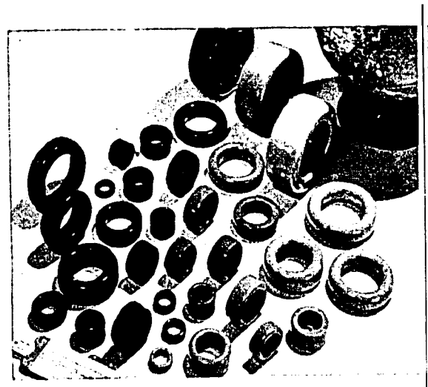
Arnold Mo-Permalloy powder toroids are available in a wide range of sizes, to obtain nominal inductances as high as 281 mh/1000 turns. They are given various types of enamel and varnish finishes, some of which permit winding with heavy Formex insulated wire without supplementary insulation over the core.

Write for Bulletin PC-109

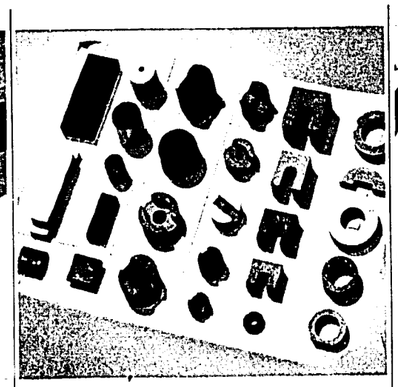
IRON POWDER CORES

Arnold quality control of iron powder cores includes the maintaining of rigid electrical, physical and dimensional specifications unmatched in the industry. A wide selection of cores is available, from simple cylinders to special cores of complicated design. The line includes all standard types and sizes of threaded cores, cup, sleeve, slug and cylindrical insert cores: for use in antenna and RF coils, oscillator coils, IF coils, perm tuning, FM coils, television RF coils, noise filter coils, induction heating and bombarder coils, and other low frequency applications. A standard series of iron powder toroids is also manufactured, conforming to the standard sizes proposed by the Metal Powder Association.

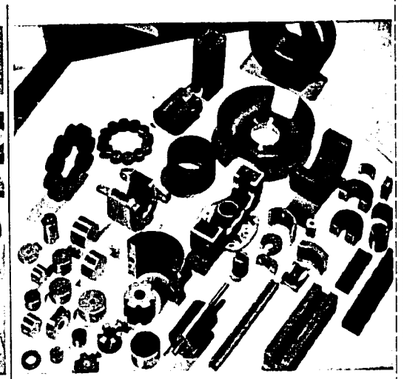
The most complete line in the industry ...made by a fully integrated producer



Sendust powder cores.



Various types and sizes of sintered Alnico magnets.



A wide variety of cast Alnico magnets.

SENDUST POWDER CORES

Write for Bulletin SDC-110

Sendust Powder Cores are available in a wide selection of sizes, ranging from .800" O.D. to 3.346" O.D., and in permeabilities of 10, 13, 25, 30, 50 and 80, although not all sizes are available in all permeabilities.

Sendust cores possess magnetic properties that are generally superior to iron powder cores, but inferior to Mo-Permalloy powder cores in the audio and carrier frequency range. The eddy current loss for Sendust cores is lower than that of Mo-Permalloy powder cores, but the hysteresis loss of Sendust cores is substantially higher, and they also have higher values of electrical resistivity. In other characteristics of powder cores, the two types are somewhat similar, but Sendust cores contain no scarce or strategic materials and can offer a core source in times of alloy shortage.

ALNICO MAGNETS—Cast and Sintered

Arnold manufactures permanent magnets from all grades of Alnico, although Alnico V is usually the preferred type due to the high value of energy product of that alloy. Alnico magnets are quite hard and somewhat brittle and may be machined only by grinding. Most sizes and shapes are manufactured as sand castings and are made to the customer's drawings and specifications. Some types and shapes of Alnico Magnets are carried as stock items.

Some small sizes of magnets may be furnished in sintered Alnico, and a wide range of shapes are carried in stock for quick delivery. Special shapes made in this way, however, require rather expensive dies.

SPECIAL MAGNETIC MATERIALS

Write for Bulletin GC-106B

Vicalloy is a permanent magnet alloy containing about 10% vanadium, 50% cobalt and the balance iron. It may be fabricated in the form of castings, hot rolled bars and forgings or cold rolled strip,wire and tubing. After suitable heat treatment, the material is quite readily machinable. The alloy finds its greatest usefulness in the form of forged rotors, stamped parts and special recording tape. The coercive force, Hc, is about 250 oersteds, the residual induction, Br, is about 7500 gausses and the energy product, (BH) max, is about 0.8 x 10^6.

Supermendur is a new material composed of about 2% vanadium, 49% iron and 49% cobalt. It work hardens slowly and can be rolled from .090" to less than .001" without intermediate softening treatments. Even after severe cold reduction, it remains ductile and can be bent back upon itself without fracture. Experimental cores measured at room temperature showed a coercive force, Hc, of 0.26 oersted, a residual induction, Br, of 21,000 gausses, and a maximum permeability, μ, of 66,000 at 20,000 gausses. Presently, it appears to be best suited for such applications as power transformers, pulse transformers, magnetic amplifiers, telephone receiver diaphragms, and switching and memory devices.

Cunife is a permanent magnet alloy of copper, nickel and iron which is malleable, ductile and machinable, even after it has been age hardened. The magnetic properties of Cunife are developed by cold working and are directional, with the best magnetic properties found only in the smaller sizes of rods or wires.

The Formula That Revolutionized Music

MATHEMATICIANS long ago divided an octave into 12 equal semitones, each a successive power of the twelfth root of 2. This "equal temperament" formula was the key to a new world of music that could be created for much-simplified instruments. We like this example of one of the Arts benefiting from one of the Sciences—and of mankind benefiting from both. The example contains the mightiest of the Sciences, a new world of thought, creativeness, and refinement of design. These elements exemplify the work of Litton Industries in advanced electronics.

GENERAL SPECIFICATIONS

Sufficient tolerance is incorporated in the specifications to allow for normal commercial component and tube deviations. Tube replacements may be made with any equivalent tubes meeting RETMA specifications.

INPUT:

105-125 VAC, 50-60 CPS, single phase. Except for Com-Pak series (models with prefix C) 105-125 V, 50-400 C.

DC OUTPUT:

Voltage Range: Continuously variable over ranges specified, except where otherwise noted.
Current Range: The current ranges given apply to the entire DC output voltage range, and for input voltages from 105 to 125 VAC. No "derating" is necessary.
Polarity: Either positive or negative terminal may be grounded.

AC OUTPUT:

The AC output is unregulated, isolated and ungrounded. It has a value of slightly higher than 6.3 V (when fully loaded) at an input of 115 VAC. This value allows for voltage drop in connecting leads. Dual outputs may be connected in series or parallel.

DUTY CYCLE:

Continuous duty at full load.

METERS:

Where meters are indicated, a separate voltmeter and milliammeter are provided.

OVERLOAD PROTECTION:

Ample protection is provided against external overload and internal failure conditions by means of fuses.
Circuit breakers of the magnetic, "trip-free" type are employed in Models 50, 50-R, 71 and "1500" series as protection against external overloads.

STYLE:

Rack Models are designed for mounting on standard 19" relay racks.
Bench Models are provided with compact, specially-designed, ventilated cabinets equipped with carrying handles. The power supply units may be removed from their cabinets for mounting in standard relay racks (except Models 25, 26 and 71).

RATINGS AND COMPONENTS:

All components used are of the highest quality and are operated well within manufacturers ratings. Hermetically-sealed, oil-filled capacitors are used exclusively. Ample safety factors are provided in the design to insure the long life, and the dependable, trouble-free operation so desirable in industrial and laboratory applications.

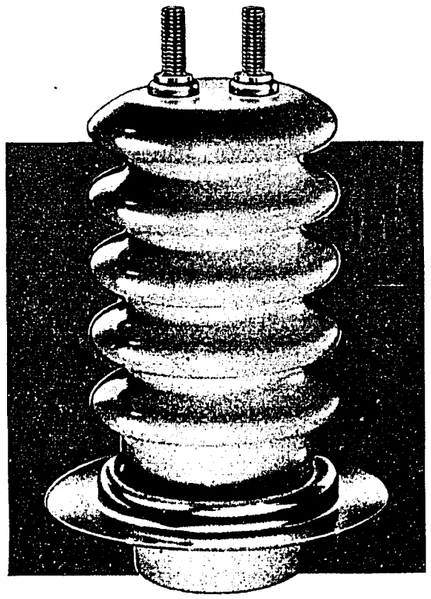
Ceramic-to-Metal Seals



NOW AVAILABLE—A standard line of Alite high voltage bushings. Sizes 2" or 2¾" diameters; 2 to 8 flutes; 1, 2 or 3 terminal studs; optional stud lengths and thread sizes.

With the addition of complete facilities for high temperature metalizing and bonding, our Alite Division offers engineers and designers a single dependable source for ceramic-metal assemblies. Now you can plan for superior quality and highest precision in electronic insulating components employing ALITE—the sintered aluminum oxide especially formulated for critical electronic applications.

Alite possesses a unique combination of properties which makes it ideal for use as the insulating body in ruggedized, high performance hermetic seals and bushings. It has exceptionally high mechanical strength and thermal shock resistance, permitting operation over wide extremes of temperature, pressure, humidity and vibration. Alite maintains its high dielectric strength and excellent low-loss characteristics at micro-wave frequencies and elevated temperatures.

Alite seals are operative at extremely high temperatures, being limited only by the melting point of the bond metal used. When Alite is metalized and bonded, using high temperature brazing metals such as pure silver, copper, gold, or their alloys, the result is a vacuum-tight Alite-to-metal seal that meets the most exacting requirements.

Get in touch with us if you have component problems involving ceramic-to-metal seals.

Our technical service is ready to handle your toughest assignments.

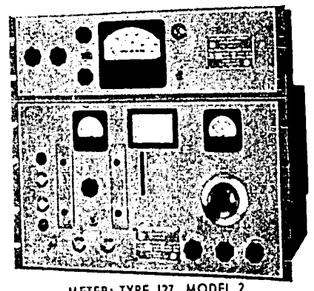
Northern Radio FREQUENCY SHIFT TERMINAL EQUIPMENT

FREQUENCY and SHIFT MONITOR SYSTEM

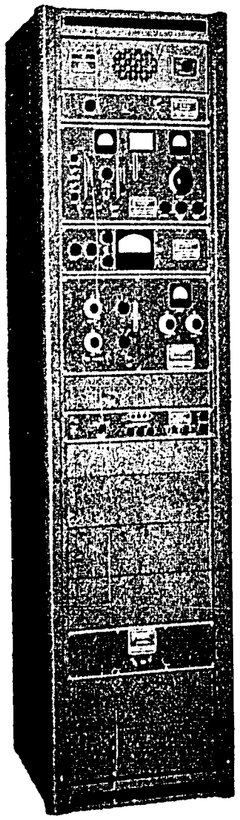


METER: TYPE 127, MODEL 2
MONITOR: TYPE 106, MODEL 4

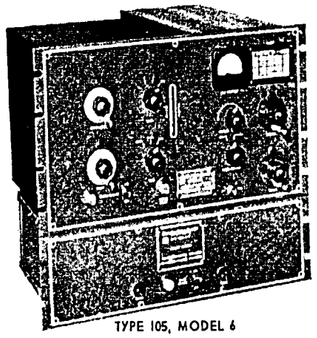
This system consists of a Type 106 Frequency and Shift Monitor and a Type 127 Frequency Meter. It is designed as a secondary standard to monitor the frequency and amount of shift of transmitter carrier outputs. It is particularly intended to measure the frequency shift of a mark and space (FS) signal either when setting up for traffic or under normal keying conditions.

The Monitor's stability is better than 2 cycles per megacycle over an ambient temperature range of 0-50° C—using crystals having a temperature coefficient of only 3 parts/million/degree C. Range is 2.5-30 mc with 10 crystal-controlled frequencies (separate panel trimmers for each); use of external oscillator also provided for. Frequency Shift range is 10-10,000 cps. Less than 100 millivolts RF input needed for 2 volts audio output.

The Frequency Meter is specially designed with selectable normal and fast-acting damping factors, permitting frequency measurements of signals while keying. Its accuracy is 2% of full scale for the ranges 0-200, 500, 2000, 5000, 20,000 cps.



TYPICAL TRANSMITTER TERMINAL for TWINPLEX OPERATION

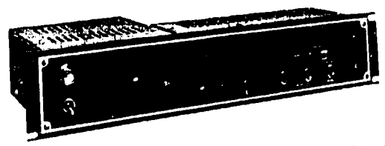


TYPE 105, MODEL 6

FREQUENCY SHIFT KEYER

Supersedes and replaces its leader predecessor, Type 105 Model 4.

- Highest stability achieved by any FS Keyer.
- Increased frequency range 1.0 to 7.0 mc.
- Pre-selection of proper FS for any particular transmitter frequency multiplication.
- Permits use with external oscillator without need of adapters.
- Improved accessibility for even easier maintenance.
- Direct-reading frequency calibration of shift from 0 to 1000 cps.
- FS dial adjusts "Mark" and "Space" frequencies equally above and below the carrier position.
- Direct-reading frequency calibration of mixer and output tuning dials from 1.0 to 7.0 mc.
- Direct reading calibration of output frequency vernier ±600 cps.
- Pulse-shaping circuit permits operation within assigned band-width with no adjacent channel radiation.
- Linear carrier shift up to 1400 cps for Fax operations.



TWINPLEX COMBINER TYPE 177 MODEL 1

For twinplex operation, the transmitting terminal includes a Twinplex Combiner Type 177 Model 1.

The Twinplex communication system makes possible a 2-channel radio circuit whereby 2 non-synchronous or synchronous telegraph transmissions modulate a single radio carrier wave causing the carrier to assume one of four specific frequencies with 400 cps separations.

The Combiner converts the four possible conditions of two telegraph signals (M1-M2, M1-S2, S1-M2, S1-S2) respectively into one of four voltages related in a 0-1-2-3 manner. The Combiner output voltage modulates the Frequency Shift Keyer.

The two telegraph channels provide the same operational flexibility as that of two separate single channel FS systems. One can, for example, simultaneously use channel #1 on 60 wpm teletype and channel #2 on high-speed Morse or Time-Division Multiplex.

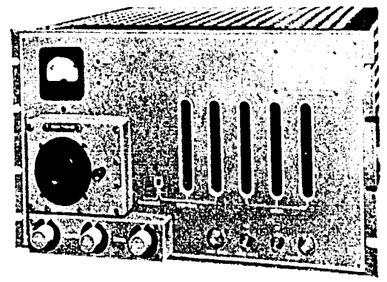
VARIABLE MASTER OSCILLATOR TYPE 173 MODEL 1



The Northern Radio Company Variable Master Oscillator provides a continuously variable source of radio frequency energy with a stability of approximately 1 cycle per megacycle in the range of 2 to 4 megacycles. It may be used as the basic control oscillator for diversity receivers, high frequency transmitters and other communications devices, or as a laboratory standard for test and measurement functions.

Its ease of operation and direct reading of frequency make it an outstandingly useful device where precise frequency control must be maintained by completely unskilled personnel. No curves, interpolations or calculations of any kind are required in its use. Frequency is set approximately to the desired value by rotating the oscillator dial. The last three digits of the frequency automatically pulls in to the valve pre-set on the switches and holds with an accuracy that exceeds that of most temperature-controlled crystal oscillators.

HIGH FREQUENCY OSCILLATOR

Output Frequency: 2—4 MC continuously variable.

TWINPLEX CONVERTER TYPE 178 MODEL 1

This Twinplex communication system makes possible a 2-channel radio circuit whereby 2 non-synchronous or synchronous telegraph transmissions modulate a single radio carrier wave by causing the carrier to assume one of four specific frequencies with 400 cps separations.

The receiving equipment consists of the Twinplex Converter Type 178 Model 1 and a single or diversity receiver such as the Northern Radio Type 110 Dual Diversity Receiving System. The Converter demodulates and separates the four audio tones from the radio receiver(s) into two channels each carrying the originally transmitted intelligence. The Twinplex Converter replaces the standard FS Converter for this purpose.

The two telegraph channels provide the same operational flexibility as that of two separate single channel FS systems. One can, for example, simultaneously use channel #1 or 60 wpm teletype and channel #2 on high-speed Morse or reception of channel #1 signals on all standard FS converters (tunable to 400 cps shift) without need for a Twinplex Converter: this is valuable for "Forked Circuit Operation" where the intelligence of channel #1 is intended for pick-up by other receiving stations which are not equipped for Twinplex Reception in addition to the main receiving stations which are so equipped. Reception of channel #2 (or of both channels) requires the receiving end to be equipped with a Twinplex Converter.

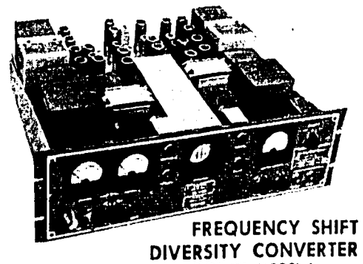
VARIABLE MASTER OSCILLATOR TYPE 115, MODEL 1

The Variable Master Oscillator Type 173 (above) may be replaced by this Variable Master Oscillator Type 115 Model 1 which is designed principally for use in diversity reception to supply variable or crystal HFO voltage to the receivers. Its variable frequency has a stability equivalent to that obtained by non-temperature-controlled crystal oscillators. It also provides 3 HFO crystals for operation of diversity receivers where fixed frequencies are required, and 2 BFO crystals.



FREQUENCY SHIFT DIVERSITY CONVERTER TYPE 174, MODEL 1

For use with either single-receiver frequency diversity systems or 2-receiver space diversity systems. By means of plug-in units, any reasonable number of channels is available between the frequencies of 425 and 3315 cps for either frequency or space diversity operation. For standard FS operation, the plug-in networks provide shift adjustments from 100 to 1000 cps shift.

Normal Input Level: −40 to +10 VU (Zero VU = 1MW into 600 ohms). (Satisfactory operation on fades to −60 VU.)
Limiter Recovery Time: Negligible for a 40 VU differential between Mark and Space frequencies.
Output: 65 ma into 2000 ohms floating (self-contained line battery).
Keying Speed: Maximum of 40 dot cycles with narrow band frequencies diversity. Up to 400 dot cycles with the wide band networks.
Monitor: 2-inch Cathode Ray tube
Input phone jack
2 input volume level indicators
1 output current indicator

MULTI-CHANNEL FREQUENCY SHIFT TONE TELEGRAPH SYSTEMS

These Multi-Channel Telegraph Systems are audio carrier systems capable of multiplexing such circuits as telephone lines, VHF, UHF, or radio frequency links—or practically any type circuit from which a two-wire audio circuit can be derived. Designed to meet any speed requirements, these systems are fully electronic, without relays or moving parts to wear. They can be used for high-speed printer, Morse or time division Multiplex circuits, as well as such application as Telemetering, Control Circuits and Servo-Mechanisms. Instantaneous and complete sending and channel control permits any binary code groups, either "Clear Text" or "Crytographic," to be channelized without need for additional phasing or synchronizing equipment, while paralleling of channels will allow for transmission of other type codes, such as 3 element cable code. The completely independent operation of each channel, including its own power supply, localizes faults to one channel only, leaving other channels unaffected. Individual channel separation filters are used at both transmitting and receiving ends. This arrangement allows for sending telegraph or control signals over a circuit carrying, simultaneously, other forms of intelligence: or for two-way communications on the same line. The audio frequency shift principle of transmission provides for high fidelity of signal reproduction over a wide range of signal levels as well as under severe noise or interference conditions. Circuit requirements of any speed, shift and center frequency can readily be met. The systems illustrated are for use on printer circuits up to 100 WPM channel capacity. The system arrangement is very flexible, permitting grouping of the basic units into various arrangements of Multiplex Systems. These systems can be made to accommodate a large variety of channel numbers and speeds to meet any individual requirements. The flexibility is further improved by the fact that the racks, power control units, and terminal connection panels are the same for both transmitting and receiving terminals.
